Thanks for the discussion of these two failure modes.

> It is also true that a clogged tube is the main reason ink refills will void
> the warrantee.

I would think that it would have to be the only "maintenence" reason, the
other being purely profit oriented (scare people into paying high bucks for
two cents worth of ink.) (By the way, I am not opposed to the profit motive,
in fact, I am trying to maximize it -- on my end!)

> It is also fairly easy to break some of the plastic parts if you don't know
> what you are doing.

Heck, you can say the same about some people's own body parts!

I actually had someone change my oil once. It cost four times what I
could do it for. I don't know what everyone else gets paid per hour, but
I just can't justify such luxuries.

> why HP does not want to have to pay for warantee repairs due to operating
> printer in a way that it wasn't designed.

And they do WANT to have to pay for in warantee work? :-)

1206. First 5 parts of Modula-2 compiler

Newsgroup: comp.sys.atari.st
Date: 1989-09-29 23:32:03 UTC
From: sale5312@fredonia.UUCP
Message-ID: <1608@fredonia.UUCP>
Source record: 248777

Yes, to any Netter with a kind soul:

I am in need of the first 5 parts of the PD Modula-2 compiler that
has just been posted to comp.binaries.atari.st. They were somehow run
through a "shredder" at my system. If possible, I'm also curious as to
what it is (if it is an editor, no problem?)

Very much thanks in advance,

-Marty Saletta

Opinions expressed are the responsibility of the author.

In article <1989Sep28.172110.7096@polyslo.CalPoly.EDU> mshapiro@polyslo.CalPoly.EDU (Blind Man With A Vision) writes:
>
>For the last few weeks, I've been trying to find a MIDI package for
>a 520ST. atari [...] told me of
>only two stores. One was about 45 minutes away and the other about
>20 minutes away. Not too bad if I live in your average town.
>HOWEVER, I LIVE ABOUT 15 MINUTES FROM ATARI'S HQ!!! Why are there only
>two stores in Santa Clara county that carry atari software? But wait,
>it gets much worse than this.

Why should there be a particularly dense packing of Atari vendors near the company's headquarters? If IBM clonesellers followed that logic, you'd have to go to Taiwan and Korea to find most of them. Stores don't spring up overnight, like mushrooms, and magically create a market. The *market* creates the need for retail outlets, and retailers move to fill the need. In the US, right now, there is very little demand for Atari computers, hence the lack of dealers.

Expensive computers are a specialty item. You will not find professional quality computer equipment at Target or K-Mart. Game machines, yes; computers, no. You are looking for MIDI software; that's an even more specialized market. Here's a clue: the MI in MIDI stands for "Musical Instrument". Does that suggest where you should be looking? If Atari has market share anywhere in the US, it's in the music industry.

>I went to this store B&C Computer in santa clara, to check out MIDI
>stuff. THey had several packages to choose from. So I asked the lady
>there if I could take a look at them.
>
>"No, we can't open the packages. We'd have to sell the software as
>used."
>
>Now, I'm thinking to myself, oh great, we've got a genius here.
>"How do you expect to sell this stuff if I can't look at it? Do you
>know anything about these?"
>
>"No."
>
><Deliberate pause...By this point, I'm just dying to see how she
>extends this line of reason.>
>"We're not salesmen We have the stuff if someone wants it."

I've been a continued customer of B&C since I moved to California almost 2 years ago. Let me tell you how *overjoyed* I was to find a store, within 20 minutes of where I work, that *specializes* in Atari computers (they sell no other brands), and has a wall full of ST software! Every other computer retailer I had ever seen that even *heard* of an ST, sold them on the side, and had all of about 10 ST titles on their shelves.

Would you, as a small businessman, really want to open one copy of *every* non-game title, regardless of cost, just because a prospective customer (who might be "just browsing") wanted a demo? Do you have any concept of how much inventory that would require, and how much it would cost?

Let's say you went through five or six packages before you found one you liked. At an (estimated, probably low) average retail price of $120 for a MIDI music package, you're talking $600 worth of inventory, and you're just one customer! Sure, they can now keep those five open packages for "demo" purposes; but they must now stock five more, unopened copies to sell, and as soon as the next update comes out, they're demoing obsolete software. No doubt you would expect them to open the latest versions for you, too. Of course, they should simply swallow the loss they take on the old, open, unsalable copies.

You should be thankful that these people are *honest* enough to admit that an opened package should be sold as used software. Many less scrupulous vendors would simply re-wrap the package and put it back on their shelves, at full retail price, and not bat an eyelash.

>As I'm walking out the door, a man behind the counter starts to tell me
>how the software business works. He says, "In this market, you have to
>buy a package and try it out. If it works for you, that's great. If
>it doesn't, buy another."
>
>Now, I'm really getting perterbed. "Look, I don't plan on buying every
>package in existence, or even more than one. I just want a look at
>the stuff before I buy it."
>
>This is a good one here...."Well, maybe you aren't ready to spend the
>money to buy something then."
>
>"Well, maybe you aren't ready to own your own store."

Well, maybe *you* aren't ready to own your own computer.

Before I go shopping for a software package, I do research. While you were at B&C, you should have stopped at their magazine rack and picked up a copy of STart, and checked out the ads for MIDI software. A visit to a Walden Books or B.Dalton's could have netted you a copy of "Electronic Musician", "Keyboard", "Music Technology", and other magazines that specialize in MIDI equipment and software. Read the reviews, the articles, the ads. If you do this, you will have some idea of what these different packages can do, what you need, and which

ones fit.

It's the job of the software *publisher* to promote his wares, not the retailer. You cannot reasonably expect the software retailer to be an expert in every aspect of the software he sells for a general-purpose computer! You're asking them to be MIDI experts, CAD experts, spreadsheet experts, word processing experts, accounting experts, compiler experts and game experts. An impossible task!

>Atari, if you're listening, maybe you should have a little talk with
>your software/hardware distributors. All two of them. They could
>use some pointers in the customer relations/sales development
>areas.

Sounds like you're the one who could use a few lessons in the economics of running a small retail business. Perhaps you could do better? I'm sure you've got the $100,000 cash in your pocket for your hardware and software inventory, displays, racks, cases, employee payroll, utilities, store rental, and advertising. All set? Good.

Now, try to earn a living selling software at an average $30-$90 *retail* price (hint: you only get to keep about $10-$30 of that). Of course on that kind of margin you can easily afford an army of trained sales staff, who are knowledgable about every package they sell and will gladly open each one for every uninformed imbicile who asks. No doubt you would *never* complain about the people who came in for the demo, but then decide to order the package by mail, because it's $10 cheaper, but then come to *you* for support anyway!

>Between the difficulties of finding a store in the first place and
>then the escapade I went through once I did, I have to wonder why people
>would want to buy an ST when they can buy a MAC and get software on
>every street corner.

Would you seriously walk into a Mac or PClone computer dealer, and expect an expert to demo, for example, every CAD package they sell, because you don't know which one you want? Be sure to tell them you're buying one copy for personal use. They'll laugh you out of the store. I dare you to try it.

>If any of you could recommend a decent MIDI package, I would really
>appreciate it. Obviously, the store wasn't a lot of help. I saw
>a few packages there, ranging from $54 to $200. I don't mind spending
>the money, if it's good stuff. Full editing capabilities, as well as
>scoring. Please, oh please, help me out.

For full editing AND scoring, you can expect to pay $200 and UP. $60 will get you a basic multi-track sequencer with little or no editing capability. I really suggest you pick up some magazines and read the reviews. There are also MIDI product guides that come out periodically. You *might* be able to get some help at a Music store that carries Atari computers (e.g. Haight-Ashbury Music in San Francisco), but you'd better look like you're ready to spend some

money. They make a lot more on the customers who come in ready to drop $1500+ on the latest whiz-bang keyboard/synth/workstation than they do on someone shopping for a $200 software package, so you can bet where they're going to invest their time.

The other place you might go for help is your local Atari user group. The Bay Area has several. You can find their numbers in the back of free papers like Micro Times, which you also could have picked up at B&C. No doubt there are members into MIDI who can give you the first-hand look at the packages that you desire.

But don't, *don't* libel the nice people at B&C for trying to make an honest living and a decent profit, in a market that is not at all kind. No disclaimer should be necessary, but here it is: I'm not affiliated with B&C Computervisions in any way except as a long-time, satisfied customer.

>Mac for 1/3 the price Apple wants.

No, you _don't_ have all the features of the Mac portable--it's still lacking the AppleTalk/LocalTalk port. Until Atari or someone comes up with a reasonably fast bridge, I seriously doubt people will _really_ look seriously at one of these, at least in a college environment.

I have tried to talk people into buying ST's with GCR as a cheap Mac alternative, but without the AppleTalk, they don't fit in to our scheme of things. So until then, my school at least won't be ordering scads of them to use as portable Macs.

>You should pick your hardware based largely on what it will run that
>you wish to run. Why else would bazillions of people still choose to
>buy XT/AT-clones (price aside :) ?
>
Yup, you're right on the ball, Steve. You should also mention that MS-Dos
is ancient and tired. OS/2 has no software support and changes from day to
day. Mac's finder is slow and anti-programmers. Unix is the epitome of
unfriendly. Why do people even try to put an operating system on computers?

>IBM/NEC/Zenith and Apple >>> OWN <<< the portable market in this country.

I'd say that Apple would have had to already marketed a few portable
machines for them to own any portion of the portable market, although they are
in a good position to sell quite a few in the near future.

>[I find it helps to think of Atari as a European company

Message-ID: <89100103302940@masnet.uucp>
Source record: 248784

The boulder/pendulum is not a red herring, but it IS the hardest thing in Barbarian. You have to get your timing in a very small window. You have to RUN (not walk) from all the way to the left to the right past the pendulum. This is the only way to get enough speed to pass it quickly. Note the pendulum moves in steps, as I recall about 8 positions. I believe you start running when it's around 3 or 4 o'clock, you just miss it as it goes up on the left and you just get by it before it comes down on the right.
Rest assured it's much easier passing it on the way back (yes you have to pass all the screens again).

I'm writing a small program that will send files to another computer unattended. What I would like it to do is dial up another computer at a predetermined time, and after handshaking, send the files.

However, I would like to know how to detect a cut off connection, such as if the host computer hangs up or line noise cuts off the carrier. I could have some sort of protocol that would determine if the modem was still on carrier, but I would idealy like to know the state of the modem at any point of time.

Thanks,

Derrick

Atari 520STfm. Upgraded to 1 meg. Only 3 weeks old. I thought my old
520 had dies so I bought the 520fm brand new. I got the old 520 working
so I no longer need the 520fm. It has a built in double sided disk drive.
Comes with mouse, RF modulator, cables, manuals,and some disks.
I'd like $550 Canadian for this computer.

Steinberg Pro 24 III v3.0 with dongle and manual. Second only to Creator/
Notator. $260 Canadian

Alesis HR-16 Drum Machine. 18 bit, 44kHz sampled drum sounds. Lots of
memory and back-lit display (unlike the R5). For you people in the USA
my price may seem high, but you don't have to import stuff made by Alesis.
The price is negotiable: $400 Canadian.

Korg DW8000 analogue synth. 61 keys, velocity, after touch, pitch bend, mod.
64 programs, full MIDI, wide range of sounds with sampled waveforms (analogue
after the waveforms). Service manual included.
Asking $900 Canadian

DynaCADD V1.38 - not music software but a very good computer aided design
program. 3 disks, manual, binder, dongle. $250 Canadian (raved about in the
latest START magazine).

Prices are negotiable. US$ = Can$ / 1.20

1220. Virus on Wordup v2.0 Disks

Newsgroup: comp.sys.atari.st
Date: 1989-10-01 16:38:26 UTC
From: woodside@ttidca.TTI.COM
Message-ID: <6583@ttidca.TTI.COM>
Source record: 248792

NEOCEPT has released an announcement regarding a virus on some copies
of their version 2.0 release disks, a portion of which is reproduced here:

"Neocept has discovered a HARMLESS virus on all of the WordUp v2.0
upgrades and new packages with serial numbers from WUP004000 to
WUP004249. This virus is completely harmless and does nothing more
than copy itself to the boot sector of all disks that are
accessed. In fact, this virus could arguably be called a
"virus killer", since it wipes out any harmful virus that may
already occupy the boot sector. It is remotely possible that this
virus could be the "key" to activate some other virus, or that this
virus interacts to duplicate some other virus. However, Neocept
has already disassembled and looked closely at the virus, and can
find no indication of how it might act as a "key". To be safe,
users should clear out all but the first 32 bytes of the boot sectors
of their WordUp disks, using a disk editor or a virus killing program. ..."

I must raise some objection to portions of this announcement.

I will withhold comments about the responsibility of software publishers
regarding checking releases for viruses. I must, however, voice strong
protests at their attempts to downplay the significance of this event.

While I have not yet received an exact copy of the virus, it has been
identified as the "KEY", "TYPE 1", or "SIGNUM BPL" virus, depending upon the
anti-virus software you favor.

There is no stretch of the imagination by which this virus could be
referred to as a "virus killer". It is a very real, fast spreading virus,
with dangerous side effects.

It WILL spread itself to the boot sector of any disk inserted into the ST
which the virus does not recognize as already containing a copy of the
virus. It will, therefore, overwrite the boot sector of a disk which must be
auto-booting, rendering the disk useless. It will spread throughout a user's
disk library quickly. It is already the most widespread virus in the USA.

More dangerous than the spread of this virus, however, is the danger it
represents if it locates the "KEY" for which it is waiting.

While the virus must be on the boot sector of the disk in drive A during a
power up or reset to become activated, no such condition applies to the
"KEY". If the virus is active, and a disk bearing the "KEY" characteristics
is inserted into the ST, the virus will execute the code present on the
"KEY" disk as soon as that "KEY" disk is accessed. It does not require the
ST to be reset. As soon as the "KEY" disk is accessed, whatever code is
present on the "KEY" disk will be executed immediately. Of course, I will

not make public what that "KEY" is. All version of VKILLER will correctly identify a "KEY" disk, should one emerge.

Let me make it perfectly clear that the virus on the WordUp v2.0 disks is reported to NOT contain that "KEY". It will not harm systems, other than to destroy boot sectors, as noted above. It will, however, cause a system to fall victim to whatever code is present on a "KEY" disk, should one be inserted into a system with this virus active. As of this writing, neither I nor any of the other virus fighters I know have located a "KEY" disk. No one, therefore, can warn you of what to expect if a "KEY" disk turns up.

While I applaud NEOCEPT for going public with this warning, and apparently stopping distribution of the virus quickly, I strongly disagree with their attempts to lessen the gravity of the situation. This virus is NOT "harmless", and is absolutely NOT a "virus killer". Viruses hurt everyone in this industry, and must be fought at every opportunity.

I have a question that sounds so simple, I hope someone can give me a hand.
What does 'ST' stand for, as in ATARI ST?
Help is greatly appreciated.
Thanks

the next upgrade for registered owners of QUIKFIND.PRG (to version 1.6) will have this capability built in. and to be able to turn it off with absolute ease as well. stay tuned for more Quick Utilities plugs ... :-) :-)

(sorry to those who feel this is blatant advertising, but this is one of the few mediums that shareware users can get update information, as well as info about new improvements in their registered versions. thanx for your co-operation!)

go jays go!

To paraphrase your own words (and the exact words can be found in your post) 'GCR has left the field of vaproware.' Explain to me why you labelled GCR vaproware when you yourself could keep tabs on its development and delays on nie? Could it possibly be that because you didn't get your SLM804 support from a one-man company and spend WEEKS harrassing Mr. Small on every Net you could find, you decide to give GCR a 'vaporware' label even though you knew when it was coming out? Give it a rest, I respect your knowledge, I don't respect your 'labeling'. Truth is that few computer products appear on time - if you really want to complain go to the Mac base and critize Apple for the laptop (brick) delay, no a one-man operation that has done a damn good job.

1225. Erratic mega keyboard

Newsgroup: comp.sys.atari.st
Date: 1989-10-02 02:10:37 UTC
From: jlemon@cory.Berkeley.EDU
Message-ID: <17899@pasteur.Berkeley.EDU>
Source record: 248797

Lately I've been having problems with my Mega's keyboard. More specifically, the 'e', '1' and 'q' keys do not want to respond to a keypress and have to be coaxed (by repeated pressing) into giving me a character. Is there any good solution to this problem short of replacing the offending keyswitch? (assuming that's the problem and not some odd chip in the keyboard). This is driving me nuts, especially the 'e' key! I took apart the keyboard, but can't get to the internals of the switch, short of unsoldering and removing it from the PC board. Has anybody had this particular problem?

1226. Portfolio

Newsgroup: comp.sys.atari.st
Date: 1989-10-02 02:23:13 UTC
From: dscheidt@van-bc.UUCP
Message-ID: <12@van-bc.UUCP>
Source record: 248798

I was able to buy one here in Vancouver last Friday ($550 Canadian -
so much for Free Trade). I got one of two left after the salespeople
grabbed them all up. So far it's great. It conforms to the article
in the October STart, except it's not MS-DOS it's DIP-DOS which appears
to be much the same thing. I thought I would be the last person to buy
an MS-DOS compatible machine, but fortunately ram-disk based .BAT files
work almost like an alias file - I have ls, rm, cp, pwd, etc. now so I
feel more at home.
Yes, the keyboard is small (as is the whole machine - fits in the breast
pocket of a suit jacket) but it is just fine for my 4 fingers+thumb style
of typing. The space bar seems low due to a ridge around the edge of the
keyboard, but I can live with that.
The good part is the ROM-based applications - they provide a completely
integrated environment with text editor, calculator, spreadsheet, database
and appointment calendar. The user interface includes windows, menues,
and single-stroke command keys - all on an 40x8 screen. It's really quite
remarkable for such a tiny machine.
And, if you can believe it, ATARI actually provides a complete and
comprehensive manual (249 pages).
So... why did I buy it? Now I can finally get my address book "on-line"
where I can back it up - no more fear of loosing that precious little black
book. And now I have a calender and appointment book that doesn't end
at the end of December (at least not until December 2049). These may seem
like trivial reasons (I still working on convincing my wife that they are
not), but I expect I will use this little box every day for the next few
years at least.
And it really does come with batteries included...

From: ADAM_TILGHMAN@bdt.UUCP
Message-ID: <152@bdt.UUCP>
Source record: 248551

Hi there! I am looking for a program that will execute a GEMDOS #0 command (terminate program) at a specific time... Is there such a beast? I am not very fluent in M68K assembly, which is what I would assume this type of program would have to be. The specific use for this program is to drop out of BBS Express! at a certain time to implement a homebrew networking package... Any feedback would be appreciated, but please post replies directly to the net, since my email address is flaky at best.

1231. PCW/Lynx/STE

Newsgroup: comp.sys.atari.st
Date: 1989-10-02 09:11:20 UTC
From: stefan@spcc386.UUCP
Message-ID: <275@spcc386.UUCP>
Source record: 248553

I've been to the PCW show in London, and it was BUSY!

On Friday, I barged into the Atari stand and saw Jeff Minter playing with the Lynx handheld. Since I know him, he handed me the wonderful device when he saw me "Hey Stefan, check it out, it is really awesome". The Atari officials became immediately nervous when some stranger held one of the two working handhelds, and after a few moments it was gently taken from me.

The thing that struck me about it is the incredible crisp display. You can almost distinguish each pixel on it. It was playing the California Games, and they were very colorful. The sprite scaling is indeed awesome, but I couldn't hear any sounds. (Just felt some vibrations at the left of the machine, I guess that's where the speaker is at). It is roughly as wide as an A4 piece of paper and it really doesn't weigh much. The controls on it is one of those 8-way movable crosses you often find on handheld consoles, and need getting used to.
I asked Atari when it was going to be for sale and the guy told me that it would be in the shops before Christmas. Also, in November you are supposed to be able to buy it in the tax-free areas of some airports (including Schiphol, I don't know the others), but that's just one of the many rumors.

The STE was nowhere to be seen, but a friend of mine has seen a developers document for it and this is was he told me:

DMA sampled sounds at frequencies from 9 to 50 Khz. The fact that it uses DMA means (in theory) that it doesn't take any processor time to play samples. The screen base vector now has a low byte (finally) and the width of a scanline can be specified in bytes, while the offset to the next scanline can also be given in bytes, so scrolling is a piece of cake. Together with the blitter and the increased color palette (too bad about the four planes still) this machine could do some breathtaking games.

The leisure part of the show was a total turmoil of noise and vision. Every stand had huge displays of the latest games, all speakers were turned up loud and long arrays of coinops and computers allowed people to play videogames, much to the delight of the hordes of teenagers who flooded the show on Saturday and Sunday. Of course, the Batman rage was very present, everywhere they sold posters, caps and stuff.

A bit of a chaotic report, but it is Monday morning and my brains aren't in gear yet.

Mitch:

You seem to be having your first dose of software buying experience.
It doesn't take long to come to the realization that buying software is not the same as buying ties, records, or fast food. The legal tangles involved in dealing in software are enough to make the squeamish flee in terror. It isn't pretty, and there isn't much justice in it for _anyone_. Most computer owners have come to recognize this in the past five years or so.

As you learn the ropes, I have just one request to make.

PLEASE DON'T FLAME SOFTWARE DEALERS ON THE NET -- UNLESS THEY ARE DOING SOMETHING REALLY AWFUL! The people you spoke to weren't, by your description. THERE ARE FEW ENOUGH ATARI DEALERS AS IT IS WITHOUT YOU MAKING THEIR LIVES EVEN MORE DIFFICULT!

Please read the following basic facts about selling software.

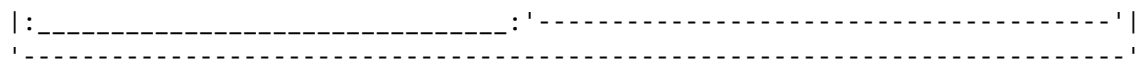
1. Piracy is rampant. A game program has a useful retail life of about three months. An application program can be sold for approximately one year.

2. NOBODY will buy an open package. Most software has a shrink-wrap agreement built in -- if you open it, you accept the terms, which means you own it.

3. The distributor will not refund the dealer on an open program. This means that the DEALER owns it -- permanently -- once it's been opened. This is not true (usually) of still-sealed programs, which can be traded back.

4. NOBODY in the ST software business is getting rich. Hundreds of ST dealers have switched to selling other computers. Hundreds of ST programmers have stopped writing for our machine. Grousing at them is not likely to make them happier to be losing money for our sakes.

So, you wonder, how are you expected to find out about programs if you can't rip into the package, have a personalized demo, bring in your keyboard and test it for a few hours?



There are several options, although few of them are as convenient as what I've described. BUY MAGAZINES. ST-Log. Start! has an annual MIDI issue with lots of reviews. Current Notes and ST-World also publish good reviews of MIDI software.

If you are lucky enough to have an Atari ST user's group in your area, JOIN IT! The local user's group has a very scant membership, in spite of hundreds of ST owners in this area. Don't let _yours_ suffer from apathy. You can find other ST owners with MIDI software and test it, get demos, and learn firsthand. DON'T pirate, though -- unless you want the revisions to stop, and the new software development to die out. The neat thing about paying for support is that you can call the developer or write a letter, and maybe have your own suggestions built into the next release. Programmers are driven people who want to please their customers when given a chance!

I've had my say. Please take these words seriously. I have seen a couple of good ST stores close simply because the owners couldn't deal with the hassles anymore. Flame the software business all you want, but take it easy on the dealers. They're simply caught in the squeeze!

The Ultradisk sounds pretty cool, Howard, but your note immediately provoked a rash of questions in my mind:

1) How much did it cost?
2) where can I get one?
3) How fast is it? Comparable to a main memory Ramdisk or a harddisk? Transfer rate?
4) how big is it (physically)?
5) how long does the battery last?
6) you can auto boot from it? (you already answered this one)
7) is it compatible with harddisks? (and this one, but I'm runnning out of questions)
8) etc, etc, etc?

Expiring minds need to know!

Thanks!

> While I have not yet received an exact copy of the virus, it has been
> identified as the "KEY", "TYPE 1", or "SIGNUM BPL" virus, depending upon the
> anti-virus software you favor.

I have confirmed the presence of the KEY virus on all three of
my Wordup 2.0 disks shipped to me by Neocept. I used George Woodside's
excellent "Virus Killer" program to detect and then eradicate this
virus from my disks. Others who have received Wordup 2.0 should do the same.
Virus Killer was posted on comp.binaries.atari.st recently.

I'd like to applaud George Woodside for his exceptional public service
in a) warning us about this virus (I'd never have suspected that a
COMMERCIAL software distribution would contain one); b) disseminating accurate
information on it; and c) providing a utility which destroys
this and other viruses.

Question: will this virus write to the boot sector on my hard disk as
well? If so, how can I detect it? (I noticed that Virus Killer only
checks and fixes floppy disks.) Thanks very much.

1241. Sound Sampling Again

Newsgroup: comp.sys.atari.st
Date: 1989-10-02 17:23:20 UTC
From: chuck@richsun.UUCP
Message-ID: <453@richsun.UUCP>
Source record: 248563

Many thanks to Johnie W. Wardlaw @usrmath.ucr.edu and all of the rest of the replies to my request. Now - for John Stanley @dynasoft and Joe Rohde at ohio-state and anyone else who is interested: I have modified Johnie Wardlaw's ST Replay 'C' code for the Mark Williams C Compiler and Replay4 sound files.

I now have another question: I am not able to play sound files larger than 32K bytes. I'm wondering if it's a matter of allocating memory or if 'bascode.exe' can't handle larger than 32K files????

Here's the code:

```
---------------------------- Cut Here ----------------------------------------
X[2-Oct-89]
X
X Here is the source for my ST Replay "player" code by Johnie Wardlaw and
X modified by me for the Mark Williams C Compiler.
X
X/*
X** sound.c Routines to load and play ST-Replay sound files.
X** (Requires BASCODE.EXE Replay file to play it)
X** Also - the sound sample Replay file replay.spl is needed.
X**
X** Written by Johnie W. Wardlaw (wardlaw@ucrmath.ucr.edu)
X** Use this code however you wish.
X**
X** Modified by (me) Chuck Menard (chuck@richsun) for the Mark Williams C
X** Compiler and the 'as' assembler used with MWC.
X**
X*/
X
X#include <stdio.h>
X#include <osbind.h>
X
Xchar player[3000]; /* Buffer for player object code */
X
Xsound_init ()
X{
X register FILE fd; /* File descriptor for BASCODE.EXE file */
X
X/*
X** Open file for read only access and binary mode.
X*/
X
X if ((fd = fopen ("bascode.exe", "rb")) == NULL)
```

```
X return( 1 );

1242. Wanted: UUCP software for Atari 8 bit

Newsgroup: comp.sys.atari.st
Date: 1989-10-02 19:53:22 UTC
From: maverick@floopy.UUCP
Message-ID: <0565.AA0565@floopy>
Source record: 248564
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Net,
I am looking for some uucp software in binary form or source code in Action!/Mac 65 for a friend. If you know where I can get this software please E-MAIL (only, as I don't read these newsgroups) replys to me at the address listed below or call (my friend's bbs) The Vidiot at (412) 935-9072 (3/12/2400) and of course, leave feedback to the sysop. Any help on this would be greatly appreciated!

What exactly does TOS store in the DTA? If it is information pointing to
the disk, how does TOS know it is still valid when Fsnext is called?
(The directory might have been deleted and the cluster reused in the
meantime...) What error codes must be expected?

1244. Latest ICD boot utilities

Newsgroup: comp.sys.atari.st
Date: 1989-10-02 20:07:43 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440059@hplsla.HP.COM>
Source record: 248566

I'd like to hear from anyone else that is using the new ICD boot program and utilities (revisions 4.x.x). I have the downloaded the latest stuff (4.1.8) from GENIE and mentioned these problems to ICD on the BB there, but the answers have not been very useful.

Problem one that I've seen is that the Mark Williams rebootable ramdisk is incompatible with the ICD cache. Installing a MWC ramdisk normally causes a warm-boot, but ICDBOOT goes ahead and re-installs its cache, which wipes out the ramdisk. If the ramdisk is in the auto folder, you just get an endless series of boots and disk installations. If I disable the ICD caches, everything works fine, just the way it always has.

The strange thing is that the recently-posted EDISK seems to be perfectly content to run with the ICD cache! (Since it is faster than the MWC ramdisk, I guess I shouldn't complain).

(ICD's response to this problem was "do you have the latest ICDBOOT"? Yes!)

The second problem is that file copies on my C:\ partition take forever without FATSPEED. Like 10 seconds for a 2KB file!!! I defragged the C:\ partition, it got slightly worse. I checked the partition with the demo version of the ICD cleanup program, no problems reported (never have been, which is why I haven't bought the program yet).

FATSPEED is the only "cure". With FATSPEED installed, everything is very fast. Without FATSPEED, almost everything is very, very slow. The problem is, SUPRBOOT has to run after FATSPEED, and the file modification operation in SUPRBOOT takes *forever* to modify the AUTO folder progs and ACCs. (It's really spooky with the ICD cache on, there are three very brief disk accesses during the file modification, with up to 20 seconds of "dead" time between them! With the cache off, of course, there are all kinds of disk accesses going on. Not as scary, but just as irritating!)

Anyhow, until I installed the new ICD driver, FATSPEED never had *that* big an effect on my Mega, it was always a 30% enhancement, not a 3000% enhancement. How could the ICD drivers have anything to do with this?

(ICD told me I need the TOS 1.4, as if I could step out and pick it up. I'm waiting for my dealer to call!)

Well... other than these problems, I will say that the new ICD drivers are remarkably fast, especially with the cache on. Between Turbo ST 1.6 and the new ICD drivers, my Mega is really cruisin'!

1245. uud bit me again

Newsgroup: comp.sys.atari.st
Date: 1989-10-02 20:08:25 UTC
From: jmorton@euler.Berkeley.EDU
Message-ID: <17919@pasteur.Berkeley.EDU>
Source record: 248567

I don't have a copy of Steven Grimm's "Welcome to Binaries"
message before me, but as I remember it does not mention
the following treachery of uudecode (or at least not strongly
enough!):

The first file in a uuencoded set has a name on the "begin"
line such that if the file is named with that name, the newly opened
arc file (with the same name) will immediately trash it.
What makes this treacherous is that the _other_ parts of
the uuencoded set _must_ be named with the name on the
"begin" line for uud to find them.

Why is this designed into such a great program?

Sorry if this is old news; when you're mad, bandwidth means nothing.

From: ts@chyde.uwasa.fi
Message-ID: <816@chyde.uwasa.fi>
Source record: 248568
Cross-posted to: comp.binaries.ibm.pc.d,comp.sys.atari.st

Mon 2-Oct-89: In looking at my older files I came upon a description
of file transfers between a home computer and a PC. Since I think
that the description of this task might be of some general interest,
I decided to make it publicly available. The particular home
computer is the ill-fated Sinclair QL, but ideas should have some
bearing on other home computers, as well. The relevant file
/pc/ts/tsqlpc10.arc is available from your site by anonymous ftp
(file transfer program). The file also contains a list of my
programs for the QL.

>
> Adam Tilghman

GEMdos #0 (Pterm0) terminates the current process. All your program would
do is kill itself, not the BBS.

Ugly kludge solution: Write a DA or TSR that reboots the system when <time>
arrives. Install autoboot software that checks the time and (if matched)
runs the networker.

Elegant solution: Take a great big magnet to BBS Express! Get STadel,
which already supports timed events and multiple networks (including this
one).

1249. Spectre and Appletalk

Newsgroup: comp.sys.atari.st
Date: 1989-10-03 00:13:22 UTC
From: cmm1@CUNIXA.CC.COLUMBIA.EDU
Message-ID: <CMM.0.88.623376802.cmm1@cunixa.cc.columbia.edu>
Source record: 248571

I must agree with the person that brought up the subject of a lack of an Appletalk interface on the Spectre GCR. I would own a Spectre now if the Appletalk support was included. Almost every job I've had in recent memory had an Appletalk network and a nice Laserwriter NX II at the end of it. How I would have loved to have had a Mega 4 on my desk running spectre (w/appletalk) instead of a wimpy little Mac plus. I had my current boss convinced into buying 30-40 Mega 4's with GCR packages until we realized that his Laserwriters would be useless without the Appletalk interface. (And don't try to tell me that we could have bought SM804', as they aren't nearly as good as the Apple printers). So the end result was that he ended up buying 25 Mac IIcx's. Typical end to a typical Atari story...sigh...

From: larserio@IFI.UIO.NO
Message-ID: <CMM.0.88.623380133.larserio@kyrre.uio.no>
Source record: 248574

Does anyone out there know what software/hardware that will work on a TT ?

Programming tools:
- Personal Pascal 2
- Lattice C
- Assempro
- Seka

GDOS-programs:
- Timeworks DTP
- EasyDraw
- GEM-Paint

Drawing programs:
- Degas Elite
- Quantum Paint
- Spectrum 512

Cartridges (does the ST ones fit on a TT ?):
- Vidi digitizers (like Vidi-ST from Rombo)
- Sound samplers (like Replay 4)
- PC-SPEED
- PC-Ditto 2 (does PC-Ditto on disk work)
- Alladin
- Spectre (both 128 and GCR)

Can somebody from Atari test some of the popular software on the TT and
inform the ST users out there of the result - please ?

|I find myself needing a really hot 68000 binary search routine. This
|routine will be called millions of times, so it should be as efficient
|as possible. I need it to go through about 10,000 items, each with a
|size of ~ 10 bytes. Does anyone have something like this already coded?

If you're really in for speed, why bother with _binary_ searching ? Use hashed searching instead. The binary one will need some 13, 14 lookups & compares, the hashing one - depending on the hashing function and the filling - much less (1? 2? 3?) plus some time to calculate the hashing function.

Leo.

In front of me I have a German Atari magazine (ST magazin; Markt und Technik, 10/89). Here is an add from Fearn & Musik (Stuttgart) that sells Spectre 128 and GCR (GCR price is DM725,- (without ROMS) and DM1025,- with ROMS) In the bottom line of this list there is a line: "Demnaechst: AppleTalk(tm) hardware Emulation"

I'm not sure what "Demnaechst" means in this context but I think it gives promises that they are working it. Any comments Dave Small?

No, the "KEY" virus will not touch a hard disk. It doesn't even know they
exist.

I'm busy re-writing Vkiller (from scratch) to enhance its capabilities,
and add some hard disk facilities. It will be a while before it gets
re-posted, but I'm working on it. So far, though, I have no information
on any ST viruses which spread through, or attack, hard disks.

If anyone has any information on viruses that Vkiller (2.20) doesn't
recognize, or on any ST-oriented hard disk or link viruses, I would certainly
appreciate hearing from them.

Source record: 248583

My last posting to INFO-ATARI16@SCORE.STANFORD.EDU bounced and I have not received any digest mailings from CANADA01 for weeks. If anyone on the net reads this, please reply to let me know I have not lost contact with the net.

I have been showing the Portfolio around; it really draws a crowd. What an elegant product. People are wowed by a hand held PC.

The STACY should do well for Atari. With PC Ditto and Spectre GCR, the STACY is the same price as a TOSHIBA 1200HB (XT portable). Not bad, a TURBO XT, a Mac compatible and an ST all in a single laptop.

I have been able to test the GCR (under a gamma test agreement I cannot release details) and I'm anxious to get my full commercial copy. Don't wait, order yours today!!!! My Ditto II was shipped to me last week and I hope to crank it up this week when it finally makes it through the mail and customs.

I had an Atari PC-4 for a weekend; it's a really nice AT compatible. True to Atari style, it comes bundled with Windows 286, Windows Write and Windows Paint and a mouse. At lease someone refuses to sell user unfriendly systems. Good show Atari!

1262. Warps

> However, I would like to know how to detect a cut off connection, such
>as if the host computer hangs up or line noise cuts off the carrier.

Carrier detect is at $fffa01, bit 1 (i.e., (*(char *)0xfffa01)&2), but
you'll have to be in supervisor mode to read that. The GEMDOS Super()
or XBIOS Supexec() calls work well for this purpose.

Also, if you're tweaking DTR, keep in mind that Offgibit() requires a mask
to AND with, so if you want to turn off bit 0x10 you'll have to pass 0xef
to Offgibit(). This had me scratching my head for a while, as it's not
mentioned in any of the documentation I have.

>The first file in a uuencoded set has a name on the "begin"
>line such that if the file is named with that name, the newly opened
>arc file (with the same name) will immediately trash it.

Yes, uud probably should warn you about that. It's easily tweakable if you
have the source.

>What makes this treacherous is that the _other_ parts of
>the uuencoded set _must_ be named with the name on the
>"begin" line for uud to find them.

What I usually do is save the parts to "part01", "part02", and so on, then

```
% cat p* >foo
% uud foo
```

If uud can't find a file of the appropriate name, it continues to scan the
file it's on.

I'll add a warning about this to the binaries intro, though (which should be
coming your way later today.)

1267. official tos 1.4 release

Newsgroup: comp.sys.atari.st
Date: 1989-10-03 15:01:23 UTC
From: steveg@com.com
Message-ID: <steveg.89oct3160123@narnia.com.com>
Source record: 248588

This is directed to the Atari folks who read this group.
First off, thanks so much for your "inside" information, giving us the facts we (sometimes desperately) want/need. I know you can't always give out the all the info you'd like, but I for one, appreciate what tidbits I can get. Now for my question:

I recently had a local dealer install TOS 1.4 into my Mega 4.
It was my understanding that the big delay in the release was waiting for ROMs to be manufactured, but upon opening my machine (warranty already expired), I noticed that I had EPROMs (or is there some new kind of ROM with a little window on the chip? :-)) labeled TOS 1.4 with socket locations. No other markings (like copyright Atari etc.). Is this a legal set? I.E. should I march down to my dealer and demand a legal set of ROMs or was there a last minute decision to use EPROM to speed distribution? How can I tell what version of TOS 1.4 I have? (Where do I look to see the release date? I understand April 6, 1989 is the official version?).
Thanks for any info you can provide. My dealer will remain nameless until I know the facts. If he's selling illegal copies I'd like to know (and I'm sure Atari would too...).

1268. Atari Mega 1 - conversion

Newsgroup: comp.sys.atari.st
Date: 1989-10-03 15:02:00 UTC

Message-ID: <8910031504.AA19238@ucbvax.Berkeley.EDU>
Source record: 248589

Dear Netlanders,

I repeat a question I asked some weeks ago to this user group.

Recently I bought a Atari Mega 1 computer. I would like to know
how this machine can be converted into a 2 Mbyte machine (if possible).
As I am not a hardware specialist, I would like to obtain a clear and
fully documented explanation. Any valuable reference to good and easily
obtainable articles would be very much appreciated as well.

Many thanks,

Frits Dumortier
(FD@BGERUG51.BITNET)

1269. TT info

Newsgroup: comp.sys.atari.st
Date: 1989-10-03 15:40:25 UTC
From: keithr@vice.ICO.TEK.COM
Message-ID: <4195@vice.ICO.TEK.COM>
Source record: 248590

Due to requests for more information on the EE Times article here are the parts about the TT:

Atari's TTs: low-cost, 68030 PCs

Atari Corp. has previewed a trio of lost-cost computers based on the Motorola 68030 processor - the same chip that powers the Mac IIx, IIcx, and SE/30, along with a handful of workstations.

The TT series systems emerged at a recent trade show in West Germany, Atari's strongest market. All sport 16-MHz 68030s and a minimum of 2 Mbytes of system RAM. The accompanying microfloppy drive lets the machines read and write data in IBM PC, Macintosh and Atari disk formats. Standard features include SCSI, parallel and twin serial ports and MIDI musical interface.

All three pack 512 kbytes of system ROM - sufficient to bundle most of the Atari operating system software in silicon with enough space left over for Macintosh emulation when Mac Toolbox ROMs are dropped into the motherboard.

Much of the time put in on the project, originally pledged at Comdex/Fall 1987, has gone to efforts to make the machines complaint with rival IBM and Macintosh applications software and to writing a version of Unix that sells for less than $300.

Low, mid and high
The entry-level Atari TT is built along the lines of the low-cost, high-volume Atari ST; its housing contains motherboard, floppy-disk drive and signal ports. The mid-range TT system boasts a 40-Mbyte hard disk and three Eurocard slots for 32-bit VME cards. The high-end TT setup delivers an 80-Mbyte drive, a maximum 8 Mbytes of RAM and eight slots, fed by a 145-W power supply.

Product spokespeople for Atari Corp. (U.S.) were unfamiliar with the forthcoming TT machines' specifications and could not comment on any of the 68030 systems. But European sources indicated the machines were assembled in the Far East and rushed to the event in West Germany late last month. The computers are expected to be available for sale in Europe this fall; U.S. delivery is not expected before winter.
The low-end machine is said to run $1500, the mid-range unit $3,000 and the premium system $5,000. A bundled CRT display, either color or monochrome is said to be standard on the midrange and high-end machines.

Monochrome capability is 1,280 X 1,024 pixels. There are two color modes: 640 X 320 pixels or 640 X 480 pixels.

IBM PC emulation software is readily available for the Atari family. Futher, many 68000 ST owners possess third-party hardware adapters that accept Apple Macintosh ROMs. The so-called Spectre 128 package allows Atari 68000-processor systems to execute Macintosh software faster than a standard Mac SE.

A $295 version of Unix for the TT series, supporting X Window user interfaces, was promised to West German customers last month and is expected to be available before yearend.

...

The rest of the article talks about the indroduction of Stacey and the ATW.

Hopes this answers some questions (and raises quite a few).

From: covertr@force.UUCP
Message-ID: <4602254a.14a1f@force.UUCP>
Source record: 248591

In article <880@per2.UUCP>, dag@per2.UUCP (Daniel A. Glasser) writes:
> Some people have gotten really angry over the lack of SLM804 support
> in the various emulators running on the ST. Although I can simpathize
> with these people, I must take exception to the accusations that they
> are making about the developers of these emulators.

Daniel, you are still missing my point. My ONLY complaint with Dave Small,
and Gadgets By Small was when Dave Small kept promising 300 dpi QuickDraw
support of the SLM804. Dave made commitments to me as far back as September
1988. Now, I realize that writing the 300 dpi QuickDraw SLM804 driver has
proven to be a BIG task. And I do appreciate the fact that Dave Small spent
so much time and effort attempting to write a 300 dpi QD SLM804 driver.
Unfortunately, it appears to have proven to be hard for even Dave and Dan
to accomplish and the latest news that I have is that the 144 dpi ImageWriter
Emulator is the currrent level of supprt for the SLM804. So, I do thank Dave
and Dan for spending so much time and effort on the SLM804. I just wish that
it had been easier to accomplish. I need to thank Atari for producing a
Laser Printer that can not be supported by third party vendors!!

>
>
so stuff omitted
.
.
.
> David Small and the people at AG would probably be willing to integrate
> improved SLM804 support if someone were to offer them the required code
> at a reasonable price in a useable form. The support would probably be
> limited to those machines with at least 2, and probably 4, megabytes.
>

I don't know why Atari doesn't provide this support?? It would help immensely
for GBS and Avant-Garde to have a software base to wrok from. Atari is the
real guilty party in producing an unsupportable laser printer. As far as AG
ever producing a pc ditto ii based SLM804 printer driver, they should talk
to Dave and Dan at GBS. Maybe the two companies could work out a common set
of software to support the SLM804?? Who knows??

> Make whatever criterion you wish for your software selection. Tell the
> world about those choices that you make. State a desire for features in
> products that you find unusable because of the lack of those features.
>

Dan, as the only printer I have is the SLM804, and seeing as how it works fine
in the native ST mode, I see no reason to buy a dot matrix printer just to use
the Spectre or the pc ditto ii emulators. So, untill and unless AG supports

the SLM804 at 300 dpi, I will pass on the pc ditto ii.

> Please don't keep whining about those "missing" features which were never
> promised by the developers in the first place. Would it be better if the
> product were delayed by the additional months/years that it might take
> for a single programmer or a small team to add those features which could
> only be used by a small minority of what already is a small market?
>

Daniel, if it is whining to ask for a promised feature, then I am whining. I have stopped 'whining' now that Dave Small has made it clear that the 144 dpi ImageWriter Emulator is the released support of the SLM804. Now, that I know what the situation is, I won't keep whining for the 300 dpi QuickDraw emulator for the SLM804 printer. All I know is that, back in 1988, even before the Spectre was released I called Dave Small and asked about the Spectre and the SLM804. Dave was honest and said that the first release of the Spectre wouldn't support the SLM804 l.p.. But, and here is the rub, Dave promised, to develop a QD 300 dpi driver for the SLM804. A year has gone bye and it has proven to be next to impossible, and Dave has released instead a 144 dpi ImageWriter emulator. so, the feature was changed when it was proven to be impossible to develop a 300 dpi driver. That is the way life is sometimes.

> Maybe someone could develop a program that runs under MAC-OS specific
> to the ST which would do a 300dpi imagewriter (or DeskWriter) emulation
> on an SLM804 and sell this as a separate item.
>

Yep, that would be nice, and I might be willing to pay some bucks for such a program. So, any takers out there??

> If we, as a user community, could have a little more understanding of
> the technology that we demand and those who attempt to provide us with
> it, morale (which is VERY important in this business) would be much
> better.
> --
>

I have ALWAYS said that Spectre is a fine product. My ONLY complaint with Spectre is the limited SLM804 printer support. That and the fact that Dave Small and I fight like cats and dogs!!! But, I have nothing but the highest respect for Dave Small, Dan Moore and the rest of the folks at Gadgets By Small.

Like many STers out there I have two STs, both with 100 meg plus hard drives.
I would like to buy an ethernet system to link the two machines together.

Are you planning to release your Ethernet boards as commerical products??

If so, when??

The 8 serial ports would be nice also. Do the serial ports support hardware
flow control?? I.e. the RTS/CTS signals?? If not, could you add these signals
to your serial ports?? High speed modems such as the US Robotics HST can communicate
at upto 38400 baud and require hardware flow control between the ST and the modem.

As far as X Windows, I can't help you there.

I have found out since my first post that the Mac portable uses an active matrix
lcd panel. Basically, this means that each pixel has an active element (i.e
transistor) driving it while I belive the SuperTwist panel that Atari uses is
an X-Y cross matrix. Anyway, the Mac lcd panel is supposed to be much faster,
even though the resolution is the same as Atari's panel. So, until we
actuallt see the Atari STacy, we can only guess about the differences.

And this points out why Atari will NEVER beat Apple; Apple produces new machines,
Atari produces vaporware!!

> a one-man operation that has done a damn good job.

Peter, I have said before that if Atari had announced a product, and it was months before it was available EVERYONE would be screaming VAPORWARE VAPORWARE. But, because it is Dave Small, and the product is GCR, which was announced early last Spring, and only now is becoming available, we can't classify it as VAPORWARE. Well, it isn't VAPORWARE now, if it ever was VAPORWARE. The GCR is shipping, from what I read on GEnie. So, what is your big complaint?? Just that I used a NEGATIVE word in regards to GBS?? Grow up!!

As far as the SLM804 is concerned, Dave Small has said that the 144 dpi ImageWriter emulator for the SLM804 is the best he can do. So, until and unless Dave Small makes a public statement promising a higher res (like 300 dpi) I won't comment on it again. I just wish that Dave Small would not make public statements about 300 dpi printing on the SLM804 unless he can back it up with a real product.

And another thing, GBS is NOT a one man company. There is Dave Small, Sandy Small (oh I know a *WOMAN* doesn't count right?? sheesh!!), Dan Moore (ok, only part time), and Doug Wheeler. so, that is 3.5 PEOPLE that I know about. Still a little company, but not a one man operation.

As far as harassing Dave Small, you should have seen some of his comments to ME. At least I have NEVER cussed at Dave Small. GBS runs a GEnie RoundTable (similiar to a newsgroup), and last may Dave left some really nasty messages (in a public topic for all to read) to me. And when I questioned the the RT Coordinator I was told that since GBS owns the RT Contract with Genie, Dave could post any message that he wants, without recourse from GEnie. So, Dave has attacked me as much as I have him. I think that we are basically even on that score. Except for the little fact that I am a GBS customer, and cussing at a customer in a public forum is not nice.

I think that Dave Small has done a wonderful job with Spectre and now with GCR. I still hope that someday Dave Small will figure out how to do 300 dpi printing on the SLM804.

Well, folks....I finally decided.....

For those of you keeping up on the story, I was looking for MIDI s/w for a 520ST or to expand to a 1040st. Well, after much frustration, I decided to....

Buy an IBM PC clone. That's right. I hope you're listening Atari. Because you have idiots for distributors, I decided to buy a pc.

This is really sad, considering that I could have had FREE use of an ST. Thos eof you who are considering buying an atari may want to look at the retail/support organization before you commit.

BTW, for those who are interested, I'm using Cakewalk for my MIDI software. So far, I'm very impressed....

A really stupid tale is now at its end.

1275. Free RAM from Atari

Sorry if this message is a repeat. I was told that nobody saw it go by at a couple of local nodes...

==========

I opened my Mega 2 last week to install TOS 1.4, and discovered a TRULY AMAZING thing. The machine had a complete set of RAM chips, a total of FOUR MEGABYTES worth, installed!!

I was freaked out! The machine was shipped in a Mega 2 box, and all of my system utilities agreed that it had two megabytes of RAM operating. And yet, there, on the motherboard, I had thirty-two 1-meg RAM chips, FOUR MEGs worth! (One strange thing about the computer, though -- it was supplied with a Mega ST4 sticker on the front. The bottom of the machine, however, had a Mega 2 sticker. The salesman told me that it was a mistake that had happened on a couple of Mega 2s they'd been shipped.)

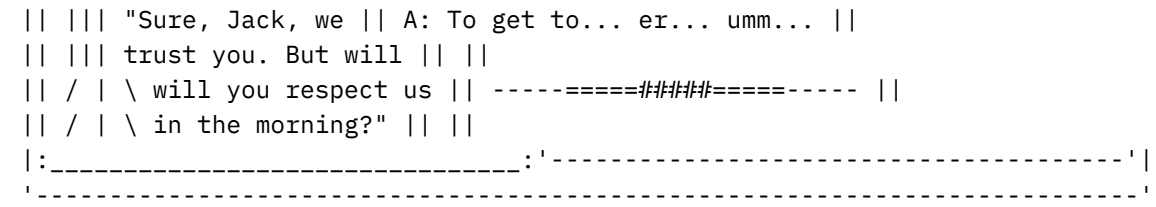
Somehow, Atari had disabled the second bank of RAM and sold this unit as a two-megger! The question was, how? I looked at the board and the schematics, and found no handy jumpers, no labels of any kind. It was even speculated that perhaps bad chips had been used.

Not so!

I took the board out completely and went over the bottom side. After intensive searching, I found that the RAS2* line -- the Row Address Strobe for the upper banks of memory, had not been soldered. I soldered.

So, for the cost of soldering one pin of one IC to the motherboard, I have a FOUR MEGABYTE computer!!

THANKS, ATARI! <several gripes forgiven!>



Next, I'm going to be peering around in there for a 25 MHz 68030 chip with some unsoldered leads!

>
>The Ultradisk sounds pretty cool, Howard, but your note immediately provoked
>a rash of questions in my mind:

Sorry for such an incomplete posting! }-) Some answers...

>
>1) How much did it cost?

I ordered mine at the Dearborn World of Atari Show, so they were discounted somewhat. Came out to around $500 for the 2 meg cartridge (expandable to 4M).

>2) where can I get one?

I ordered directly from Alpha Systems. 216-374-7469, 24 hour, call 'em and ask for a (free) catalog. I've seen other mail order places listing their products, but don't have any names offhand...

>3) How fast is it? Comparable to a main memory Ramdisk or a harddisk?
> Transfer rate?

From Qindex13.PRG...
A: C: N:
GEMDOS 97% 1147% 1451%
DMA 112% 6814% 4388%

The C drive is my Quantum 80 hard drive, the N drive is my first Ultradisk partition. Kind of surprising that it's slower than the hard disk for DMA operations... btw, 120ns RAMs are installed.

>4) how big is it (physically)?

It's kind of an L-shape, but when plugged in to the cart port, the remainder is about 3-4" wide and 6" long...

>5) how long does the battery last?

The docs say "several hours" as long as the adapter jack has something plugged into it. (Smart switch connected to the jack.) In practice, I've had the thing completely powered down for about a week (went on vacation) and it still had everything intact when I powered up the ST.

>6) you can auto boot from it? (you already answered this one)

Yep, you can autoboot, and you're supposed to be able to disable the autoboot with the Ctrl-Shift keys, but I haven't been able to get this to work. As such, I tend to use a program like bootedit to select auto programs & stuff. (For those times when I need to boot from a floppy. Btw, Falcon runs great off

the Ultradisk.)

>7) is it compatible with harddisks? (and this one, but I'm runnning out
> of questions)

Yep, I have no problems using it and the Supra autobooter...

>8) etc, etc, etc?

Hm... Well, since I have a Mega, I didn't get the clock option. It allows using up to 60K as a printer buffer, which I find very handy. I haven't opened it up yet, but expect to fill it to 4M sometime soon. (Heh - an 8 meg ST. Cool stuff.) No technical specs for what the driver does, unfortunately. No passthru for other cartridges either, also unfortunate. I'd like to use it with Minix, but for now I'm sitting idle on that. Sorry I didn't measure an in-RAM RAMdisks for comparison, but (understandably?) I don't keep any of those around any more...

>
>Expiring minds need to know!

1278. STfm vs. ST

Newsgroup: comp.sys.atari.st
Date: 1989-10-03 17:50:39 UTC
From: lake@ka3ovk.uucp
Message-ID: <1989Oct3.175039.15105@ka3ovk.uucp>
Source record: 248599

Does anyone know what the differences are between a STfm and an ST internally?
I have a program that runs differently on an ST (520, 1040, Mega) vs. an STfm. The program bombs at a certain point on an STfm.
Is it possible that the ROM code is different on an STfm? Is memory configured differently?

Direct mail bounced, so I'm posting here...

To the person looking for C and Pascal compilers for the ST:

Try taking a look at Prospero Software's line of compilers. They have C, Pascal, and Fortran. The three are compatible (object module level I believe) so that you can call C routines from Pascal, Fortan from C, etc. I personally have their Pascal compiler and have been pleased so far. It comes with an integrated 'workbench' environment a la Turbo Pascal. The editor (at least my version) is rather slow, but quite usable. The package also comes with GEM, AES, and VDI documentation that is quite informative and INDEXED. I have no relation with Prospero except as a satisfied customer - thru tech support I recently found I had a rather old version, so I have an upgrade on the way ($10 handling fee), I will post more if people are interested. Also, there was a review of a number of compilers in Current Notes a few months back, again, I can look up the issue if asked.

1280. Ham radio software search

Newsgroup: comp.sys.atari.st
Date: 1989-10-03 18:14:11 UTC
From: sharpe@plx.UUCP
Message-ID: <2065@plx.UUCP>
Source record: 248601
Cross-posted to: comp.sys.atari.st,rec.ham-radio

I am trying to locate ham radio related software to run on my
Atari 520 st. Any leads in this regard are well appreciated.

1281. RE: Sony MFP-11 3.5 drive for ST?

Newsgroup: comp.sys.atari.st
Date: 1989-10-03 18:20:00 UTC
From: DJLEWIS@UALR.BITNET
Message-ID: <8910031821.AA01303@ucbvax.Berkeley.EDU>
Source record: 248602

Mr Bernardo,
That is indeed a good price for a Sony Drive. Not being familar with
that particular model number (MFP-11) if it is double sided then it is a great
deal. The usual thing that has to be done to an add-on drive is removeing
terminators. Termination that works fine in the IBM/clone invironment causes
real havac in the ATARI st world. I find the RADIO SHACK externals when on sale
for $ 99.00 are pretty good. These are TEAC drives, after removing termination
and adding an external power supply form RADIO SHACK also about $10.00 They
work quite well. I use two internal TEAC's from RADIO SHACK in my modified
1040 st. as well as a built in 30meg hd.

1282. v08INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1989-10-03 18:37:50 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <34437@grapevine.uucp>
Source record: 245921
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 8, Info 1
Archive-name: intro

[There's some new stuff here as of volume 8, so read at least the first
section. -sg]

This is the first of three introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup. A companion
article lists all previously-published binaries, and a third article explains
how to retrieve and unpack binaries posted by others.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@panarthea.ebay.sun.com

--------------------

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@panarthea.ebay.sun.com. If you are on a UUCP-only site, you
can send them to {backbone}!sun!ebay!panarthea!atari-binaries.

If you're in Europe, you can send binaries to the European submoderator,
Jan-Hinrich Fessel, at unido!atari-binaries (or, if you're a masochist,
atari-binaries@unido.informatik.uni-dortmund.de.) He will test them and
forward them to me. Submitting to him saves net bandwidth, so it's
encouraged.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, software
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

If you are submitting both sources and binaries, please send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a
while.

Also, as of volume 8, I will only accept binaries packed with an archiver
for which source code is widely available. For the time being, this pretty
```

much means arc and zoo. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st is fine.)

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.binaries.atari.st: binaries and "information postings." They can be distinguished by the subject line:

Subject: v08INF2: Index and other info

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v08i081: bigdisk -- GEMDOS patch to allow 32-terabyte partitions

identifies this as the 81st binary article in Volume 8. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v08i041: mtgem -- Multitasking GEM replacement part04/18

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: uuencode, 1meg, medium, high

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

uuencode - program is uuencoded (UNIX uudecode required to unpack)
uue - program is uuencoded (ST uud required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: good@atari.UUCP (Roy Good)
Posting-number: Volume 8, Issue 80
Archive-name: tos1.8

The "Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The "Reply-To:" header line in the article's main header points to the submitter, to make commenting about binaries easier.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

1283. v08INF2: Index of previously-published binaries

Newsgroup: comp.sys.atari.st
Date: 1989-10-03 18:43:01 UTC

1284. v08INF3: How to retrieve/unpack binaries

Newsgroup: comp.sys.atari.st
Date: 1989-10-03 18:46:32 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <34439@grapevine.uucp>

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: October 3, 1989

_1. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than normal text. Usually, a binary that is posted to the net will contain executable (program) files. Binaries are distinct from _s_o_u_r_c_e_s, which are the human-readable text files that are interpreted by a computer and used to produce binaries. Sources can be modified with relatively little effort, and are usually pretty easy to read. Binaries are not intended to be viewed by a human.

_1._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and electronic mail) are not always capable of handling a pure binary file. They are designed to handle textual messages, and the odd symbols and characters in a binary cause them to become confused, and often to mangle the binaries. To avoid this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencoding translates a binary file into text characters, so that the news and mail transport programs won't mess up. The disadvantages are that uuencoded files are about 30% bigger than the raw binary files they represent, and that you have to go through one extra step to get the binaries to work on your computer.

_1._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work properly. The extra files might be data files, help files, or maybe some instructions for the user. In order to easily package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown together.

To confuse matters even more, a new archive program called "zoo" can also be used to achieve the same effect.

Zoo is superior to arc in some respects, slightly inferior in others. Unfortunately, you can't unpack a zoo archive with arc, or vice versa.

Using Binaries -2-

_1._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 45000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator will usually post introductory articles, including a list of previously published articles.

_2. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week (usually much less) of the time they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site panarthea.ebay.sun.com has all the binaries stored in its archives.

The other way to get binaries is to request them from panarthea's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you. One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have

been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

To find out more about the archive server, send a mail message containing the word "help" to archive-server@panarthea.ebay.sun.com. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@panarthea.ebay.sun.com to report the problem.

There are other archive sites, too, such as terminator.cc.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. (Some sites, such as terminator, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp terminator.cc.umich.edu", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information.) A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect.

Panarthea also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of the archive-server's index files for the binaries and sources groups whenever new files are added. Note that if your site gets comp.binaries.atari.st, requesting autoindex is pointless and a waste of net bandwidth. Send mail to autoindex-request@panarthea.ebay.sun.com if you'd like to sign up.

_3. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple

of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc on your Atari.

A version of uudecode written in ST BASIC is available in panarthea's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's

---
|- UNIX is a trademark of Bell Laboratories.

_s_o_u_r_c_e_s and not binaries). Once you have that, you should get the files "arc," "arcdoc," and "uucode" from volume 1 of the binaries directory. They contain the arc program mentioned earlier, its documentation, and a much better, faster version of the uudecode program.

Use the BASIC program to uudecode the two encoded files; then use arc to unpack the better version of uudecode. (Arc is documented in "arcdoc.") Note that if you're reading news/receiving mail on a computer (such as a UNIX system) that already has uudecode, you can skip most of this; you will probably just want to uudecode arc there, then download it (using kermit, xmodem, or your favorite transfer protocol - consult your site's administrator and your Atari communication package's documentation for more information. Remember to use binary mode when downloading arc files!)

So far, everything has been small enough to fit in one piece, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source code, also suitable for compilation on UNIX systems, is available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so

don't give any of the parts the same name as the file that's being extracted from them!

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass

(with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files.

Most archives contain documentation; refer to the instructions in a specific program for usage information and the like. If you have problems with a particular program, send mail to the submitter (listed near the top of each part.) The moderator doesn't have time to become very familiar with all the programs that are posted, so the submitter will probably be much more helpful.

_4. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be wrong. Mail servers usually respond to the word "help" alone in a mail message. Some of the sites listed below may not contain full archives of comp.binaries.atari.st, and some may have other files.

1285. Re: Latest ICD boot utilities

Newsgroup: comp.sys.atari.st
Date: 1989-10-03 20:00:17 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440060@hplsla.HP.COM>
Source record: 248605

I guess I should have anticipated this... I've received several requests
for the new ICD utilities. I'd like to honor these requests but I cannot.
ICD disallows *any* distribution by people that have downloaded from
Genie/Compuserve. They just re-iterated this in the roundtable. If you have
an ICD Host Adapter and are not on Genie/Compuserve, then you have ICD's
address and they will upgrade you for a nominal fee. Aside from download,
this is the only way to get these utilities.

1286. keyboard parts

Newsgroup: comp.sys.atari.st
Date: 1989-10-03 20:01:01 UTC
From: mikew@wheeler.wrcr.unr.edu
Message-ID: <3010@tahoe.unr.edu>
Source record: 248606

I have a broken keyboard- kids dropped a toy on it.

The 0) key is gone- I need the grey plastic key itself,
the white (nylon ?) insert and the rubber "spring" that effects
contact closure.

Where can I get these?

1287. Re: REFILLING HP DeskJet INK CARTRIDGES -- a warning...

Newsgroup: comp.sys.atari.st
Date: 1989-10-04 00:43:20 UTC
From: mitchell@cbmvax.UUCP

In article <4056@ucselx.sdsu.edu> coffey@ucselx.UUCP (pat coffey) writes:
>
>I've been refilling my hp carteidges for about 6 months now, and,
>last weekend, my dj stopped printing. I put in a brand new cartreidge
>that had an expiration date of 12/90 and it printed about 10 pages
>and then died. Ususally when the cart. is running out of ink, it
>starts skipping and printing lightly. This time, it just stopped
>printing all together. I cleaned it as well as I could, but, alas,
>nothing. I am trying to get it repaired now.
>
>I hope I didn't break it by refilling; but I may have. :-(

Try cleaning the electrical contacts on the print head & DJ. I think the
DJ manual mentions something about this.

I have had my DeskJet for over a year with *no* problems. But I've never
even dreamed of using refilled cartridges. Also, I never leave my printer
on- I turn it on only when I need it, and off it goes when I'm finished.
Less to worry about- like spikes and the like!

1290. Re: Spectre and Appletalk

Newsgroup: comp.sys.atari.st
Date: 1989-10-04 03:56:28 UTC
From: jca@pnet01.cts.com
Message-ID: <472@crash.cts.com>
Source record: 248610

A good test of whether or not AppleTalk emulation works is to take TOPS for Mac and run it or to hook the ST with a Spectre to a GatorBox. If it works, then I'm convinced, if not, then it's more emulation hype. Although, I do admit that AppleTalk is independant of the Mac since there are enough AppleTalk boards for the PC out there.

1291. Wordup 2.0 Virus

Newsgroup: comp.sys.atari.st
Date: 1989-10-04 04:20:15 UTC
From: jmorton@euler.Berkeley.EDU
Message-ID: <17973@pasteur.Berkeley.EDU>
Source record: 248611

Just want to mention that I found the key virus mentioned by George Woodside on my Wordup 2.0 disks. The serial number is nothing close to the range cited by the message from Neocept, which was something like 4000 to 4299. Mine are something like 100610.

Check your disks!

Thanks George!

1293. ST curses?

Newsgroup: comp.sys.atari.st
Date: 1989-10-04 06:00:27 UTC
From: rogers@ncrcce.StPaul.NCR.COM
Message-ID: <1587@ncrcce.StPaul.NCR.COM>
Source record: 248613

Does anyone know where I might get a public domain version of "curses"
written for the ST? I'd like to get it in source form, if one exists.

Thanks.

Yes, ST curses does exist. Unfortunately I do not know where
and how to get it :-(. If someone reading this has that package
please post it to comp.sources.atari.st so that a lot of people
(including me) can have a benefit out of it! Thanks in advance!

From: federico@actisb.UUCP
Message-ID: <710@actisb.UUCP>
Source record: 248616

I recently received an index from panarthea, and found that the last version listed there was 1.03.04.05, the same I have on my machine. But this dates back to the end of 1987, and I can't imagine that Bammi has kept his arms crossed all this time. Is there another version out? How can I get it? Please, no ftp addresses, since I get red and green out of envy everytime I see one of those. You know, Germany belongs to the Third World (or to the Dark Side of The Force, I can't make up my mind), and I could fly to the US, pick up a copy of the program and take you out to lunch for a fraction of the mensual fee for a TCP/IP connection.

On the same topic, is there any server where I can get LaTeX and related stuff?

Source record: 248618

I want to thank Rana Dutt for contacting me re: Is anyone out there?

Re: Spectre GCR and PC Ditto II, for those who are negative on the concept of emulation; please remember that there are users whose needs may be quite different from yours and emulation is both a need and a want for them.

Case in point. When I arrived at my desk yesterday, I found a note and a Mac disk. The note asked me to move EXCEL files into LOTUS for a co-worker in Manitoba and into LDW for another one on site here in Ontario.

I powered up my 1040ST and when my batch file displayed a Mac, IBM and Atari logo and asked "What machine do you want to use? M=Mac, I=IBM, A=Atari", I hit M for Mac and went into Mac emulation mode. Using GCR, I slipped in the Mac disk, hiked the files into my EXCEL version 1.5 and exported them to WK1 format. I ejected the disk, hit shift HELP to cause a cold boot and then came up in Atari mode. I moved the .WK1 files to a DOS-ST format disk and read them into my LDW 1.1. Voila!, job done in a couple of minutes.

Once Ditto II comes in, I'll be able to uninstall my PC apps from my XT and run them on my ST --- faster than on the XT!!!!!!

Finally, do not downplay the Portfolio until you have seen and used one. Also, keep in in perspective as to which market it is targetted at, i.e. NOT the laptop market. About a month ago I asked Atari to restore my faith and they have.

To close, yesterday, my dog, who was my very best friend in the whole wide world, was killed. His name was Max and I'll miss him forever. Bye for now because I have tears sliding down my cheek. Bye Max, wherever you are.

1298. Master Sound - Virus Warning

1299. EPSON GRAPHICS on Pana 1124

Newsgroup: comp.sys.atari.st
Date: 1989-10-04 15:38:35 UTC
From: terrell@cadnetix.COM
Message-ID: <9718@cadnetix.COM>
Source record: 248620
Cross-posted to: comp.sys.atari.st,comp.sys.ibm.pc

I'm having a little problem with my Panasonic 1124 printer:

I have a program that generates a bitmapped image for EPSON
compatible printers. On the 1124 all the bits seem to be in
the right places, but the spacing between "lines" is too small.

What I mean is that after the printer prints each row of graphics,
it doesn't advance far enough for the next row. Consequently
the rows all overlap.

Any way to get the spacing correct???

Thanks in advance,

Eric Terrell

>the 'e', '1' and 'q' keys do not want to respond to a keypress and have to
>be coaxed (by repeated pressing) into giving me a character.

My 520-keyboard did the same after 2 years of use.

Cleaning the contacts didn't solve the problem.

Replacing the 40-pin socket for the 6301 processor did solve the
problem.

If You do not dare to un-solder the socket, try to pull out the
processor, plug a gold-plated (expensive) socket in and plug the
processor to that.

The pins of the socket have a greater diameter, so they get more
pressure and better contact; the gold plated socket does not corrode as
much as the tin plated ones do...

>like to make the keyboard separate, but I don't know if adding a whole
>length of cable (say two metres) will affect the operation. Has
>anyone else tried this, or can anyone say if the connection needs to be
>as short as it already is?

My cable is 1.5 meters long. Works fine:

Find out the 5 wires for the serial interface: Send Data, Receive Data,
+5 Volts, Ground and -RESET.

Connect two 9-pin D-Sub connectors to the 17-wire connector. Now You
connect Mouse an joystick to the keyboard.

If You need a real long cable, use line drivers for the serial lines (74
07 and pullups or the like). I use 7407 and a pullup to +12 Volts as
sender and some 40XX CMOS chip as level converter at the receiving end
of the line (makes 2 TTLs and 2 CMOSses); I use the +12 Volt for power,
too. My keyboard has a 7805, so it gets real +5 V, not just 4.something.

From: gjh@otter.hpl.hp.com
Message-ID: <570032@otter.hpl.hp.com>
Source record: 248625

A cautionary note ...

There *was* a short discussion several weeks ago, initiated by someone's misunderstanding about the "wm" U**x window terminal software. At least one person thought that Xwindows had been ported to the ST. No-one was able to confirm that X had been ported. A colleague suggests that a port might not be as daunting a task as it might first appear, the ST appears to be one of the types of m/c which the designers of X had in mind when they designed X.

I'd like to echo 1(M) the previous respondent's questions. I think there'd be a *lot* of interest in networked, X-windowed STs, I mean, what an effective non-dumb graphics terminal t'would make.

In common with many other US citizens, my knowledge of the Norwegian language is zero. I got rather excited when I saw miniinfo posted in the binaries group, because miniterm is a promising looking program, but configuring it is not something I'm all that anxious to do without documentation. After using uudecode and lharc, miniinfo becomes a file with a .dtp extension (I'm guessing Calamus input, but strictly from ignorance). A string search shows what appear to be declarations of several D.E.G.A.S. images and a very small amount of text. I really don't want to say anything bad about leoe, who has provided some attractive software for no money, and whose command of my native language is much better than my command of his. But this borders on torture. Could we get a more generally readable set of instructions for configuration and the use of any non-obvious commands?

>the disk, how does TOS know it is still valid when Fsnext is called?
>(The directory might have been deleted and the cluster reused in the
>meantime...) What error codes must be expected?

You pays yer money and you takes yer chances. The semantics of the DTA mean you can't be sure of anything. If each process had a dedicated place where Fsfirst-type information was kept, the OS could invalidate it or update it or whatever. As it stands, Fsfirst/Fsnext is a big lose. Basically, you shouldn't do any file or directory creation/deletion calls and assume your DTA is still worth anything.

The last question, however, gives me a chance to address something I've been noticing lately: people expecting only CERTAIN error codes from certain calls. ANY (long) NEGATIVE VALUE returned from GEMDOS indicates an error. Don't just check against the error codes you "expect" -- check for ANY negative value. If you don't, your program won't work when we change GEMDOS for something like a network: what if you didn't "expect" to get "EFLOCKED" (file is locked)?

You can certainly report errors any way you want, and a different message for each error is not a bad idea, but you must be sure to treat any negative value as an error -- the "unknown error" alert is better than proceeding like there wasn't an error at all.

Re : Looking for Compilers

One of the better C compilers is the Laser C (formerly Megamax)

Re : Blitter Upgrade for 1040ST

I wanted to know if I could install a blitter in my 520STFM. So I went to
see my local Atari developer (he just happens to run a shop). He didn't
know but said he would ask the Atari rep. *He* didn't know either!!!
So back to square one. Next port of call, two mail order companies in UK
A) Third Coast Technologies and B) Frontier Software. Both these came up
with "If there's a space on the board for one, then yes you can fit one".
That means rows of soldered holes mind.

Re : What's ST mean ???

According to ST World, ST User and others, SIXTEEN THIRTY-TWO. (This might
be incorrect, as it actually seems logical given that the M68000 is sixteen
bit externally and thirty-two bit internally.)

Re : STFM vs. ST

ST stands for,well see above. While STFM stands for ST with "F"loppy and
"M"odulator. The ST was the original machine which came without a modulator
and had a disk drive plugged in the back instead of internally. The STF
replaced it, guess what this had a disc drive built in, and finally a
progression to the current version the STFM.

>
BTW I tried cleaning the contacts and it did nothing. When HP repaired it,
they replaced the entire carriage mechanism. Everything from the platen
on down! It looks like over half the machine. It was done under
warranty, so I didn't have to pay for it. The point is that HP doesn't
just replace the priming mechanism --they replace a huge part of the
machine. I'm glad I didn't have to pay for it and don't want to in the
future. The cost of a new cartridge is less than the cost of
dinner for 2 at a fairly nice restaraunt so I'm not taking any chances.

For you who are mechanically minded, you may want to try to un-clog the
priming tube your self. The problem is that it feeds in and out of the priming
cam cover and I have no idea of how to
1. pull it out .
2. put it back .
i.e. it goes into a black box and comes out the other end.

I have no idea of what was broken; neither does the dealer. It had something
to do with the priming mechanism.

To Dan Moore or David Small,
What is your status on Appletalk??
I thought I read on GEnie that you had investigated it once.
Am I mistaken??

It seems like instead of spending time on sound you could get
more sales by making an Appletalk interface for the Spectre or the
GCR.

Couldn't you have included an Appletalk interface in the GCR??
Could the DC Port serial io box be used as an Appletalk interface??

There seems to be a lot of demand for the GCR with the Appletalk interface.

Well, just wondering.

:
:GEMdos #0 (Pterm0) terminates the current process. All your program would
:do is kill itself, not the BBS.

By the way, what about a more consistent 'process' management in one of the
future releases of TOS ? I think it would be nice if resident programs would
kick themselves off the list when issuing Pterm(), not the last one launched.
I had this problem during developing terminal interfaces for a BBS. I had to
keep all the interfaces (called via trap interfaces) resident at the same
time {:-(
Is it possible for you to allow such a dynamic 'process' management (including
memory release after 'process' termination) under TOS, Atari ?

Andy, you mention using TurboST and the ICD cache and FATSPEED,
but just wait until you get TOS 1.4 in 100 ns EPROMs and Tubo16 (T16)!!

I just had my 18 month old Mega ST4 refitted with these new clothes and it SCREAMS!!

I have NEVER bought a product that I like (Heck, *LOVE*) as much as T16!!

It was easy for my dealer to install, and the high speed TOS EPROMS make it
even faster!!!

Desktop refreshes are done literally in a blink of an eye!! I have a 3 year
520ST sitting next to my TurboMegaST (tm) and it crawls compared to TMST!!

So, if you to get the max out of your machine, run don't walk to your nearest
ST dealer and get T16 from Fast Technology!!

Hey, I had a switch installed just so I could slow down my MTST to play some
games like Macadam Pinball!! I can't wait to try out Flight Simulator or
Gunship or FALCON!!

Richard (T16s forever!!) Covert

Thanx to all the people who responded to my question (help me pleeeze...).
On a different note...
Are there any ST game programmers out there? Ive been writing games for
a while now, mostly in 68000 code and some in M Williams C. If anyone is
interested in discussing technical topics realted to ST game prgramming drop me
a line. Ive written some really efficient routines in machine code to handle
sprites and do fast parallax scrolling that id be willing to share with anyone
since I know how much of a bitch they can be to write. Im also looking for
anyone how can draw video-game type objects on the ST to use in a game.

>BTW, for those who are interested, I'm using Cakewalk for my MIDI
>software. So far, I'm very impressed....

It's funny, but I started with a true blue PC and Cakewalk and then decided to buy an Atari. I like Cakewalk and still use it all the time, but when I needed to get a sample editor program I couldn't find one that would work satisfactorily on my PC. The problem was that my PC has one of the original CGA adapters, so I'm limited to the number of sample editor applications I can run. (This is one of my main beefs with the PC, there is such a profusion of graphics adapters that it is difficult to find an application that does what you want on the hardware you have. Worse yet, there doesn't seem to be any emerging defacto standard hardware configuration for PC music programs, unless you only look at programs that have a character graphics interface.)

Faced with having to buy a new graphics adapter monitor in order to get a decent sample editor program and, I decided to spend the money on an Atari 1040 ST instead. Now I have two MIDI computers, it's great, I can run a sequencer on one while I'm using an algorithmic music generator on another, or a sample editor or whatever. This setup also doubles the available software I can run. In short, I'd say that both the IBM PC and the Atari St are only first generation tries at MIDI computers. Hopefully, boxes like the NeXt or perhaps Unix workstations will begin to take hold in the MIDI world, but first they have the get the prices down. At any rate, I'm still waiting to see a really good computing platform for MIDI applications, so in the mean time I have to make due with what I have.

Source record: 248643

OK, the miniinfo file is a Timeworks DTP info sheet - no instruction !!
Here is how to change the settings in MiniTerm 9.31:

Load the file MINITERM.INF into a text-editor or word-prossesor
To edit something just type over the old data....
First there is some configuration data, files, zmodem progs etc...
Then there is the standard rs-port setting
Then the 20 f.key dial-dirs (10 normal, 10 with shift)
Then the 20 macros which work when DCD is active

Every data field starts on a TAB setting
The only thing you must remember is that !!!!

Just ask if there are more problems.... Sorry the configuration can't be
done from within MiniTerm, but i wanted the program as short as possible
A friend of mine has made a SETUP931.PRG to configure MiniTerm...
I'll get an english version and post it as soon as possible....

Source record: 248646

I have been having a problem getting my Okidata 390 to print graphics correctly with my 1040 ST. The problem seems to manifest itself most frequently in the 24 pin emulation mode. The problem is being that 3 bytes (24 bits) of data are being sent to the printer to print a single column of dots. At some random time, so it seems to me at least, one of the 3 bytes gets droped and the entire rest of the line is screwed up, beause of byte misalignment. Does anyone have the same problem or know of a fix.

From: dnewton@carroll1.UUCP
Message-ID: <715@carroll1.UUCP>
Source record: 248647

Does anyone know how to put a cursor in a GEM window? I finally figured out a bunch of fun text-to-GEM-window routines, just pass in the window handle, an x and y, and a string, it'll stick it to the window (or at least in the clipping region)...

But!!! I need to build a really simple text editor really really really quickly and am having trouble doing a cursor. there's no good way to save what's underneath a character (i mean, a good fast way w/o resorting to assembler, and i don't know assembler on an ST too well) so i need help in a big way.

Thanx in advance.

In the discussion about the Spectre GCR, Richard Covert says:

>As far as harassing Dave Small, you should have seen some of his comments
>to ME. At least I have NEVER cussed at Dave Small. GBS runs a GEnie
>RoundTable (similiar to a newsgroup), and last may Dave left some really
>nasty messages (in a public topic for all to read) to me. And when I
>questioned the the RT Coordinator I was told that since GBS owns the RT
>Contract with Genie, Dave could post any message that he wants, without
>recourse from GEnie.

Unfortunately GEnie was lying to you... As the "owner of an RT Contract
with GEnie", I posted an extremly innocuous message replying to a user,
telling them that I did not support contests which generated "junk" uploads.

The General Manager of GEnie personally *ordered* me to delete my message,
telling me "this was no way to answer a customer's question".

It turns out the contest was involved in an RT which was one of his "pet"
projects, and he wasn't above violating contracts to see that it succeeded.

This man has probably the lowest standard of ethics of anyone I've ever
had the misfortune to do business with, and his word is that of God on
GEnie. If he cared to tell GBS to grovel in the mud, or bend over in the
shower, GBS would do it, or be locked out of GEnie before you could blink,
regardless of what their "contract" might say.
So don't believe everything GEnie Customer Service may tell you. They want
to keep their jobs too...

1332. Re: Ethernet, Atari?, and X Windows

Newsgroup: comp.sys.atari.st
Date: 1989-10-05 08:47:44 UTC
From: decouty@irisa.fr
Message-ID: <1530@irisa.irisa.fr>
Source record: 248353

In EUUG (European UNIX systems User Group) newsletter, vol 9, No 2, summer 89,
there is a paper called:
'X/ST/window' by Michael Gehret, mg@xsoft.uucp
which describes a port of X window server on Atari ST.
From the paper, X runs either through serial lines or through Ethernet (tcp-ip)
on ST (no mention of any ethernet card). It uses a new OS, called X/ST/multi,
"a multi-tasking operating system that is totally compatible to TOS".

The system requires 2 megabytes, but no hard disk. The software was
cross-developped on HP 9000/330 workstation.

xsoft= X/software, Gro"nenbach, West Germany.
This paper was the second article in the series on window sustems, presented
by William Roberts (Queen Mary College, London, UK), liam@qmc-cs.uucp.
Perhaps this person has the source of the paper...

That's all folks.

There are (i think) three ways:
1 When the cursor type is not important, write the cursor in XOR mode.
delete him by writing in XOR mode again.
2 do a blit-operation to get the current character.
3 do it the "right" way: just put your cursor, and give an update event
if you want to delete him.

1336. Spectre GCR question answered

Newsgroup: comp.sys.atari.st
Date: 1989-10-05 12:51:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8910051248.AA21294@ucbvax.Berkeley.EDU>
Source record: 248357

Several netters asked me to clarify what Spectre GCR is compared with Spectre 128. The latter, which I have used for quite some time (prior to Spectre 128 I used Magic Sac), effectively turns the Atari ST into a Mac compatible computer. However, because the Mac has a completely different way of reading/writing disks, the ST cannot read Mac disks with Spectre 128.

Spectre 128 uses Mac 128K ROMs, the same chips inside the Mac SE. Magic Sac uses the old 64K ROMs and lots of software released lately will not run with the 64K ROMs, thereby making Magic Sac somewhat of a dead-end product.

Spectre GCR (GCR stands for Group Coded Recording, the way a Mac reads/ writes disks) lets the ST use Mac disks while in the Mac emulation mode. For example, to show some users that YES, Spectre GCR is for real and DOES WORK, we popped in a disk with the latest Mac users' newsletter on it and read it into MS Word 4.0 on an ST under Spectre GCR. There, before the eyes of even die-hard Mac users, was the latest Mac newsletter on an ST, in a Mac program read from a file on a Mac disk.

I am very anxious to get a STACY, the ST laptop, and plug Spectre GCR into it. Today, on our site, we have a Mac laptop demo. Our special corporate pricing is supposed to be about $6000 CDN so I'm told. STACY + GCR, while lacking some of the great features of the Mac laptop (like its pixel mapped screen), will have a street value (not corporate price) of less than $3000 CDN and that includes a 20Mb hard disk. We might be able to get three STACY + GCR combos for the price of a single Mac laptop if corporate pricing is good.

I was also asked about the LYNX (formerly the Atari Portable Colour Entertainment System or APCES). Latest word from Atari Canada is the end of this quarter (looks like they'll miss the all important Christmas market to Nintendo's Game Boy!)

Finally, my Ditto II has still not made it through the mail or customs. Netters will have to wait a while for info on hands on experience from me.

1337. 850 interfaces and modems

Newsgroup: comp.sys.atari.st
Date: 1989-10-05 14:41:40 UTC
From: clf3678@ultb.UUCP
Message-ID: <1371@ultb.UUCP>
Source record: 248358
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,misc.forsale

I've posted this before, but now that I finally have some power supplies for the following items, I'll post it again:

850 interfaces for sale - includes power supply. Reconditioned units, fully tested. Does not include SIO cable. $45

Avatex 1200 modem - fully tested, reconditioned. Includes power supply. these are not the 1200hc modems. $40

You should include $5 per item for shipping.

Also available: 850 -> modem cable for the 850. About 3.5 feet long. $7.

If interested, leave me a message via any of the addresses listed below, or call my BBS. I prefer that you NOT leave a message via Usenet E-mail (if possible) because the school's system isn't set up right, and I have great difficulty getting a reply through. However, if you don't have the alternative, leave message here.

I have a Magnavox that I am VERY satisfied with. It has analog, and
digital RGB, as well as composite (TV/VCR video signal) and audio
connections. Works great on my st (which uses a standard ANALOG RGB),
IBMs usually use TTL (which is digital RGB) and TV/VCR/8bit Atari/etc
all use composite (the video/audio ins usally RCA plugs). It has (in
my opinion) a little better resolution than the ST color monitors,
blowing away the new-style color monitors, and maybe a little better
than the older ones. The price is a little CHEAPER than the ST
monitor. I paid $200 for mine locally at full retail price. I
recently got a second at a hamfest for $60. Very cool monitors (which
I use as TVs most of the time. Also nice and light and they come with
a nice 5 year warranty (something Atari doesnt provide).

Any monitor that has Analog RGB and a audio in RCA plug will work.
You do need to get a cable from that wierd Atari-specific monitor plug
to the standard RGB plug with a little lead for the audio line. I had
no trouble finding these cords locally at a large Atari dealer.
Sorry, I dont have any specific names.

(and no I am not affiliated with Magnavox, I am just a VERY pleased
customer... you know the bit...)

> with earlier machines, one also has this problem, the rest do not.
> Any ideas?

First and most likely problem is that a pin either
a. missed the socket and is sticking out -- you can see this.
b. a pin tucked under the rom -- you can't see this.

the only way to handle case b is to CAREFULLY remove the roms
1 at a time, and check them. Of course, there is a slight probability
that you will fold a pin under while doing this, so its a bit frustrating.

Also, are you really sure the roms are in the correct order?

Finally, you may have a malfuction, that tos1.1 didn't stress.

good luck

Demnaechst means "real soon now".

This ranges from weeks to years.

I know of an engeneer, who tried to add Appletalk to the ST. The
prototype board plugs to the Centronics (printer) port and has
Appletalk, Apple Desk Top Bus and Centronics outputs.
Works pretty well with an hacked version of Aladin (the german Stectre
competitor).

The bad news: It's exspensive.

It does not make sense to pay DM 2000 for a Mac-emulator if you can get
a Mac for DM 4000...

> sure Atari would too...).

Well, my feeling is that Atari has really dropped the ball on the release of TOS 1.4!! There have been 'illegal' versions of TOS 1.4 floating around for weeks now!! And the illegal copies have fixes in them for several bugs in the offical Atari TOS 1.4 release EPROMs (or ROMs). For example, TOS 1.4 has a bug in the Serial IO code which has been fixes by an industrious hacker way up North!! And the hacker had to show it to Atari in order for ATari to fix it. And Atari's fix was a patch program that you need to load in your auto folder. So, already, before you can even buy a legit copy of TOS 1.4, you need to start loading in patches!! Sounds a lot like TOS 1.0 and TOS 1.2 doesn't it??

And you can't BUY TOS 1.4 in FAST EPROMs to be used with Fast Tech's Turbo16 16 MHZ board. If you could get TOS 1.4 in 100 ns EPROMS, T16 could run even faster when accessing the TOS code. But, try to buy TOS 1.4 in fast eproms. Ha!!

So, TOS 1.4 is getting spread and ATari is losing sales simply because they don't know how to market the upgrade!!!

And you have to wonder how a company that can't even distribute an OS upgrade can market an multi-tasking multi-windowm multi-user super fast workstation like the TT!! Ha again!!!

I am going to keep my Mega ST4 and my 520ST but it will be snowing in Phoenix in July before you see me buying a TT. Lack of support from Atari is why!!

I just wish that Atari would release the source code to TOS and let the hackers support the darn thing!! It couldn't be worse then the non-support that Atari provides now!!!

I only posted this to North America last time...so I think I'll give
it one more chance.

Many thanks to Johnie W. Wardlaw @usrmath.ucr.edu and all of the rest of
the replies to my request. Now - for John Stanley @dynasoft and Joe Rohde
at ohio-state and anyone else who is interested: I have modified Johnie
Wardlaw's ST Replay 'C' code for the Mark Williams C Compiler and Replay4
sound files.

I now have another question: I am not able to play sound files larger
than 32K bytes. I'm wondering if it's a matter of allocating memory
or if 'bascode.exe' can't handle larger than 32K files????

Here's the code:

```
--------------------------- Cut Here ----------------------------------------
X[2-Oct-89]
X
X Here is the source for my ST Replay "player" code by Johnie Wardlaw and
X modified by me for the Mark Williams C Compiler.
X
X/*
X** sound.c Routines to load and play ST-Replay sound files.
X** (Requires BASCODE.EXE Replay file to play it)
X** Also - the sound sample Replay file replay.spl is needed.
X**
X** Written by Johnie W. Wardlaw (wardlaw@ucrmath.ucr.edu)
X** Use this code however you wish.

A German company, X-Software have ported X/Window server (version 11
release 3) for the ST running under X/ST/Multi, a multi-tasking but TOS
compatible OS. It costs DM2000 (approx #670 sterling) for the software.
This will give you a 19200 baud serial X/Window terminal. To make the
most of things however you can get Ethernet/CheaperNet from DM1500.

Their address is :-

X/Software,

W

Well, what happened to me was that I got into a heated argument with David Small (owner of the GBS RT on GEnie) about his lack of support for the Atari SLM804 laser printer. I was particularly concerned because of an article that David Small wrote which appeared in the May 1989 issue of the USA ST paper-magazine ST WORLD. In that article David stated that he had 300 dpi printing on the SLM804. When I asked Dave about this, in a specific topic in a specific category in the GBS RT on GEnie, I was royally flamed!! Really flamblaed!! So, Dave and I got into a shouting match which ended when he started cussing at me. I then asked the GBS RT Coordiator about Dave leaving me such nasty messages in a public forum, and I was told that since Dave owns the contract to the GBS RT he can leave whatever messages he wants, without recourse from GEnie. Needless to say I stopped leaving messages in the GBS RT after that!!! Talk about Freedom Of Speech!! I guess it

onlys works one way on GEnie!!

Anyway, I want to make my peace with Dave Small. He has provided a 144 dpi ImageWriter emulator for the SLM804, so now I can get draft quality printouts on my SLM804. If I ever get the GCR I can take my Spectre floppies to work and use the Mac LaserWriters there I guess. So, while I really would like to see 300 dpi on my SLM804, I can live with what Dave has provided so far.

And finally, I have NEVER criticized the Spectre or the GCR except for the lack of support of the SLM804. Otherwise, they are both fine products. Just be warned if you own the Atari SLM804 laser printer!!

Richard (Proud SLM804 owner for 20 months!!) Covert

1349. Using SC1224 as TV

Newsgroup: comp.sys.atari.st

Hi: Recently, I was using Uniterm 2.0e to download a binary file from my local mainframe using Kermit. The file transfer worked and Uniterm saved the file, but the directory entry is not on the disk. I know the data is on the disk because I used a sector editor to find it {that was easy...it was a fresh disk}. Is there anyway I can reconstruct the file? Even on a temporary basis so I can copy the data cleanly? The file was about 180K long and I would hate to have to re-download the file. I don't know too much about the format of directory entries or where the directory sectors are on the disk so any info would be appreciated!

1352. DeskJet Owners Note (solution to short-lived ink cartridges)

Newsgroup: comp.sys.atari.st
Date: 1989-10-05 21:30:32 UTC
From: canada@crash.cts.com
Message-ID: <488@crash.cts.com>
Source record: 248373

The October issue of the ST Informer (ST-related newspaper) has a letter from a ``disatisfied'' Hewlett Packard Deskjet owner. He was upset because his ink cartridges didn't seem to last very long (in one case he only got to print 7 or 8 pages before the cartridge gave out). He phoned HP's DJ support center and was told that this was not uncommon. He was told he needed the ``correct short ink cartridge life'' kit that HP has just developed. It is *FREE* to all DeskJet owners, and should solve their problems with ink cartridges.

I called and asked for the kit and a bit of information about the problem. The woman in customer support said that they are having a lot (I guess ``a lot'' is relative, but they are definitely having more problems than expected) with short-lived ink cartriges. The kit consists of a depriming agent and a new ink cartridge (and instructions, of course :-).

You can order this FREE kit yourself by calling (503) 757-2002 and asking for the ``correct short ink cartridge kit'' for DeskJet printers and providing your DeskJet Printer serial number.

1354. "Non-Volatile" Ram Disks

Newsgroup: comp.sys.atari.st
Date: 1989-10-05 22:21:36 UTC
From: jmarek@td2cad.intel.com
Message-ID: <2466@td2cad.intel.com>
Source record: 248375

Are there any "non-volatile" ram disks for the ST. In general, the way these work is that periodically (or on command) changes are flushed to a backup disk file. On power-up/reboot, the contents of the disk file are written to the memory disk.

On a semi-related question, is there any problem with keeping an ST running continuously?

Thanks.

John.

Does Mathematica work under Spectre 128? I thought I remember a list
a few months back which said no. What's the prognosis if it is still no?

(I will probably buy Spectre if and when mathematica runs under it.)

1356. apple laptop

Newsgroup: comp.sys.atari.st
Date: 1989-10-06 00:25:59 UTC
From: ignac@electro.UUCP
Message-ID: <1099@electro.UUCP>
Source record: 248377

at a A/V trade show in toronto this afternoon, i actually got to see and touch the dreaded apple laptop. nice machine. trackball for a mouse, and the most amazingly crisp laptop screen i've ever seen. incredibly fast response, and like i said, superbly crisp. seems like they've done a nice job here. the main problem, as far as i'm concerned is the lack of a standard number pad. like, does apple hate people who type numbers, or what? and apple still doesn't seem to have a normal set of cursor keys, arranged like the atari or an PC/AT. like, do people have to use that bloody mouse for everything. (i had to find something to bitch about apple, right???) :-)

anyways, like i said, its out in the marketplace. not just talk, but the real thing. who cares if it costs $8000 in canada. people and corporations are gonna snap it up since its AVAILABLE. that's right atari, you can say it too. AVAILABLE. AVAILABLE. not rumours or styrofoam mockups. AVAILABLE. its real. you can go to an apple dealer and actually touch it! i saw what seemed to be a completed stacy back at WOA in detroit, and that was way back in june i believe. its now october. where is it?? do we loyal atarians have to always dream of the machines that were promised years ago?? oh well, it looks like apple will win again at a game that just a few months ago could have been wrapped, signed sealed and delivered (or whatever the saying says) by Atari. now who's gonna get excited over Stacy when you put it next to the portable mac??? at least a couple of months ago, there was nothing you could have placed Stacy beside!!! oh well. enough griping about atari's and apples. i just can't seem to get as worked up over these damn computers as i used to back in the good old days. :-)

by the way, at this AV show, there were Amiga's by the sh*tload being displayed for character generation for the video market. seems like the amiga, with its genlock capabilities, is an excellent low cost character generator for low end video productions, such as small cable companies, etc. now, with the STE, the amiga killer :-), coming out, is it gonna have the capability to genlock the video output with an external sync source, so the Atari can be used as a low cost video workstation. i can't see that the amiga is SO far advanced that only the amiga suffices for the video market. atari should do something about getting into the video market. there's a lot of money to be made out there in that ballpark. (hint hint hint hint)

go jays go

The Poly/Mega/Ultradisks from Alpha Systems are nonvolatile - plug into the
cartridge port, and use an external power supply. Unless you're specifically
doing something crazy with the HDV_ vectors, (like some malicious program
tries to write zeros over every sector of a random drive?) there's no way
a runaway program on the ST can trash what's on it. I've got a 2meg Ultradisk,
and it's worked well for me so far. (However.... [Isn't there always one of
these?] There's a catch - I haven't thought too hard about this yet, so the
answer may be obvious to any of you reading this... I originally had mine
set up as a single partition, 1988K of space, (and 60K for the printer spooler.)but found
that things flaked out and I lost my FATs after a point. I've now
got it set up as two partitions of near 1meg each, and haven't had any trouble.
Hm... It seemed to claim to be a single-sided disk drive. Perhaps that was
too much storage to be addressed by a 12 bit FAT entry?)

>On a semi-related question, is there any problem with keeping an ST running
>continuously?
>
I usually keep my Mega 4 running all the time. Kept my 1040 running all the
time as well. No problems yet, after 2 years or so...

usual disclaimer... I don't even know anyone at Alpha Systems...! }-)

1358. Were you able to extract MINIBBS.LZH ?

Newsgroup: comp.sys.atari.st
Date: 1989-10-06 01:47:54 UTC
From: ljdickey@water.waterloo.edu
Message-ID: <2686@water.waterloo.edu>
Source record: 248379

A few weeks ago, someone posted a program called MINIBBS.

I got it, and I think I would like to try it. But I can not get at it!

It came packaged as MINIBBS.LZH. I enquired about and found
that I needed LHARC to unpack it. So I got that. It did
not work on my ST2. Some kind soul sent me another copy, and
that did not work either.

If you were able to unwrap that program, and would be willing
to send me a copy, would you please send me a note? (Please,
don't mail the big file without checking first!) I think that
I will have to stick with ZOO or ARC for a while, since that
LHARC does not seem to work on my system.

And MINIBBS.LZH also failed to extract on a PC with the original LHARC --
I think it was either archived with a non-standard LHARC or it lost
something in the posting.

I read the following article in this group.

```
---->>From: .......@jhunix.HCF.JHU.EDU (.............)
---->Subject: Software for sale(complete)
---->Date: 26 Sep 89 16:28:29 GMT
---->
---->All packages are complete..superb condition /w manuals, but some are
---->missing boxes.
---->
----> ...
----> ...
----> ...
----> St-DOCTOR 10.00 Memory and disk editor
----> ...
----> ...
----> ...
---->
---->Anyway, I need money for the upcoming atarifest in Virginia and have grown
---->tired of these titles. off to gain some more.
----> ...
---->thanks.
----> -.............
---->
```

Since I thought that I would like
to have a handy utility, I replied that I would buy the copy of ST-Doctor.

He (I've removed the name to protect the guilty) emailed me an address
and a request for postage. OK, fair enough. I sent it right away. Last
night when I got home the package was there. I opened it right away.
Then I got PISSED!

It appeared to be a copied disk. The disk had no label. There was a
photo copied label of the original label cut out and placed on the disk.
Not stuck on, just placed on top of the disk! The edges of the 'label'
weren't even cut straight. The manual is the standard 35 pages you would
expect, the staples had been removed and not replaced. Makes it much
easier to copy the manual, you know.

Now, if I've judged this episode incorrectly, I will be more than willing
to publicly eat crow and appologize. However I don't think I owe the
appology.

I have been wronged! The author and publishers of this software have
been wronged! Atari users are wronged by this type of activity! This
seemed to be the place to air my anger.

You, sir (the un-named seller) are a cheap-assed cad. I do not appreciate
this type of treatment. I hope you have the decency to feel remorse.

Thanks for listening,
Terry

> Rock Lobster!

Yes, I own an ST and I'm not ashamed to admit it. I've had it for over 2 years and I get a lot of use out of it. I'm expecting DRAM chips any day now to bump my 520 up to 2.5 Meg (I don't have a hard disk yet). Currently, I have upgraded to 1 Meg.

Speaking of hard disks, does anyone have any comments on the new 40 Meg interchangable hard drives. I've seen quite a few of them advertised at pretty reasonable rates. 25 ms seek-time isn't too unbearable.

I'm new to the Net, and all these questions have probably been answered a hundred times before, but.....

1) What does this new new TOS 1.4 do for me, Joe ST? Is this an upgrade everyone should get? What kind of bugs does it fix?

2) If I decide to get the upgrade, what are the pros/cons in purchasing the Roms or getting it on disk?

3) If I get it on disk, how much memory will it eat as overhead?

4) If I get it on Rom, who installs it? Do I have to send it to Atari?

5) Where can purchase either the Roms or the disk version?

Any info is appreciated.

1370. Fast Tech T16 vs. JATO Board

Newsgroup: comp.sys.atari.st
Date: 1989-10-06 15:24:21 UTC
From: news@tut.cis.ohio-state.edu
Message-ID: <65232@tut.cis.ohio-state.edu>
Source record: 248391

I've got the JATO Jet Accelerator 16mhz Board for $99. It appears to slightly
speed up some things, but I haven't noticed much of a difference. Apparently
it only helps during internal processing, but that's usually not much of a
bottleneck.
Is this board different from the Fast Tech Turbo16 that I've seen mentioned out here alot?
In what way? Which is better? Will using TOS 1.4 with
JATO give me that nitrous jolt that someone claims (Rich Covert)?
My main purpose in buying JATO was to increase graphics speed in 'C',
and the increased processing speed helps somewhat, sometimes. Unfortunately,
it looks like in order to really get a performance increase for graphics, I'll
need a stronger processor (68030, TT, MAC, SUN) or maybe that new graphics
board ...
Any comment,
From: thamer@lilac.cis.ohio-state.edu (Mustafa Thamer)
Path: lilac.cis.ohio-state.edu!thamer

Bruce Blanar asked for help recovering a file when the data is on the disk but there's no directory entry. I recently needed to recover a file from a disk with an invalid track 0. Norton Utilities on a PS/2 worked fine. It's versatile, well documented and fairly easy to use.

For this particular problem, it may be possible to read in a whole lot of raw sectors using memfile (a freely-redistributable desk accessory binary editor provided by the NeoDesk folks), write out the contents as a file, and possibly spruce it up a bit with a debugger (the Atari debugger seems to have the features needed). Maybe. Norton will work for sure.

This has probably been asked before, butI haven't been reading this group
for long.

1) Is there any way to get a 1040ST (TOS 1.4) to use HD (1.4M) disks? I
tried to format one and the machine refused. (Gave the same error as
when you try to format a write-protected disk.

2) Does somebody know how to get a 1040ST to read floppies written by an
IBM PC? I have a Sun386i at work that can write IBM-compatible disks,
and I would love to bypass the download.

Send replies to me, I will summarize to this group.

Thanks,

-Israel

>notice in your posting. How about a modified GNU copyleft instead
>(you may not copy unless your recipients may, et c.). Or did you really
>mean to post something which no one may have or relay ??

Nonsense -- if someone posts something with a copyright, you can have a copy, but you cannot republish it or claim that it is your own. By posting to the net, it is clear that net redistribution is OK. What would not be OK would be to remove the Copyright notice and sell it as your own.

I always give away any software I write, but I also copyright it so that it can't be ripped off -- I include a notice that free distribution is permitted, but not incorporation in a commercial product.

> Well, my feeling is that Atari has really dropped the ball on the release of
> TOS 1.4!!

Lots of feeling, no understanding. I tried to send this email, but
uunet doesn't know where "force.UUCP" is.

You suggest that Atari go ahead and produce updated TOS 1.4 ROMS. This is
probably a bad idea. Can't you just see customer service: "I have this
problem", "What version of TOS are you running?", "TOS 1.4, I just bought
it from my dealer", "Which one, new TOS 1.4 or old TOS 1.4???"

Or, a user sees TOS14PATCH.ARC on his BBS, and wonders if he's
supposed to run it or not. It's vastly easier to have all TOS ROMS
distributed for a long time be the same, and for all users to need the
same patch program. This is the only philosophy that makes sense for a
home machine. Atari isn't Sun.

On another topic, Richard flamed Atari for not providing more software
support to people trying to get the SLM804 working with Mac software.
Atari provides sufficient support that if you can make a bitmap, you
can output it to the printer. This is how the DVI program for the
SLM804 works. The problem is generating the bitmap on the Mac. You can
either generate it using Postscript (which could be licensed from
several sources), or implement Quickdraw for an arbitrary bitmap.
General Computer sells Mac laser printers that work this way.

In either case, this isn't an Atari-only problem -- it's the same
problem you'd get hooking up ANY "dumb" laser printer to a real Mac.
It's a bit silly to expect Atari to pay several programmers a bunch of
money to implement such a critter when it won't sell many STs. And
it's silly to expect David Small to do it if it would take so much
time it wouldn't be cost-effective.

Many "technical" decisions are really marketing decisions. If we want
to get Atari to do something, let's ask for something useful, not
something stupid.

Can I get down off my soapbox yet? ;-)

>memory disk.

That would be silly. What if you did some work on a ram-based file right
after it had been saved then had a power failure? Or just turned the machine
off? If that's what you want, fine, but it would seem like a waste.

Maxidisk (PD) is reset-proof and does have an autocopy program with it,
but I don't know of any non-cartridge non-volatile ram disks.

>On a semi-related question, is there any problem with keeping an ST running
>continuously?

God I hope not, 'cuz mine's one probably 20 hours a day. And a lot of
BBS's use ST's.

Source record: 248453

In article <5558@portia.Stanford.EDU> zimm@Portia.Stanford.EDU (Dylan Yolles) writes:
>Is it possible
>to connect a third party hires RGB monitor that could handle all of
>the ST's resolutions? If such a thing is possible, how will the hires
>quality compare to the SM124? What is the price range on such monitors?

Any "Multisync", "Flexscan" or the like can be wired up to the St to
handle all 3 resolutions.
Just follow the pinout of the monitor outlet; R, G and B are self
explanatory, sync can be separetad (Hsync/Vsync) or composite and so on.

The 2 scan modes (35 kHz for high res, 15 kHz for color) are switched by
the mono detect line: ground tells the ST to do high res.

Monitors, that are not able to handle scanning at multiple frequencies,
cannot be used for all 3 graphic modes; they can possibly be damaged!
The scanning frequency is (in older, "pre-multisync" models) used as
time base for the high voltage generator, generating the 10 to 20
kilovolts necessary to accelerate the electron beam. The higher the
frequency, the higher the voltage: a 15 kHz monitor (this is the video
standard!) could be converted to an expensive heap of junk...

hope, this helps

> I find advertised in _Computer Shopper_? Do I have to buy a
> drive made specifically for the Atari ST? Is there a way to
> make a drive that is designed for an IBM PC work with my Atari.
>--
I have built acouple of H. Drives for the ST. My method is as follows:

Items needed : SCSI Hard drive (any size)
ICD Host adapter
Power supply (wattage determined by HD needs)

I have a Seagate st-138n, and it uses approx. 17 Watts MAXIMUM.
The host adapter uses maybe 10 Watts Max. and I have a 30 Watt
power supply.

The ICD host adapter comes with all the software you need. From
this point on it is all just mounting and plugging it together.
(Setting drive select to zero: instructions come with drive)

First, I would buy the host adapter, it supports most SCSI drives, but
use this to determine what drive you will buy.
(It supports all Seagate, Miniscribe, and lots of others)

ICD Mailing address:
ICD, Inc.
1220 Rock Street
Rockford, Il 61101-1437
or
815-968-2228

Recommendation : Use SCSI....
It is faster, easier to work with (setup), and you can chain
up to 8 hard drives to just 1 ICD controller.
The adapter also has another ACSI in port for Laser printer, or other stuff.

writes:
>
> I thought the STfm added the high-density (720k) drive, but besides that
>were identical?
>
The difference is:
When the first 1040 came out it was called the 1040st.
Approx. 1 or 2 mos later the name was changed to 1040stf.
Later it was changed to 1040stfm.

The difference from the 1040st to the 1040stf is:
Some origional 1040's had floppy problems. I believe the manufacturer
was Sony. When Sony coerrected the problem they changed the name to
1040stf. F standing for fixed. This happened in about Jan or Feb of '86.

This I know, I worked at a computer store that sold ST's.

I believe the m in 1040stfm stands for modulator. The motherboard was
slightly changed for the modulator, even though some did not come
with one.

1387. Help! Anyone with BMS200, Micropolis 1357 hard drive or HDX301

Newsgroup: comp.sys.atari.st
Date: 1989-10-07 00:43:29 UTC
From: cwilliam@brillig.umd.edu
Message-ID: <CWILLIAM.89Oct6204329@brillig.umd.edu>
Source record: 248458

I need help getting my hard drive to format!

My setup is a BMS200 card, Micropolis 1357 180MB hard drive, Atari 520
using BMSINIT.PRG version 2, HDX 3.01, and would be willing to try Supra

I have tried both BMSINIT.PRG and HDX301 and could not format the
thing! I do have PARITY disabled. I believe I should be setting the
drive information to 11 heads, 1024 cyl, 34 s/t. Has anyone gotten a
Micropolis 1357 formatted? If so, please send me a message telling me
what jumpers are set? I have only W9 set on the back. I have the
default jumpers on the reverse of the SCSI card on the drive.

I would like to be able to use HDX301 since the 180MB requires the
bigger partitions HDX offers. Has anyone gotten a non-ST506 or
Megafile drive to work with HDX? Berkeley said that many drives dont
work with HDX and Atari doesnt care since it only supports (!@#%$)
their own drives.

I greatly appreciate your help.

Chris

1388. Re: Atari, TOS and GEM (LONG!)

Newsgroup: comp.sys.atari.st
Date: 1989-10-07 00:55:27 UTC
From: kbad@atari.UUCP
Message-ID: <1719@atari.UUCP>
Source record: 248459

rehrauer@apollo.HP.COM (Steve Rehrauer) writes:

| Recently in this group I called Atari's TOS and GEM software "junk".

You are not the first, and no way will you be the last to do so.
And thank you for your reasonable apology - something rarely seen
after a "blathering" post.

And now... on with the Inquisition. Steve, you ask a _LOT_ of questions!
Here we go...

| So, Atari, are we ever going to see any substantive improvements to GEM?

I consider Rainbow TOS a "substantive improvement." All the same,
Atari is still working on improving and updating the operating system
for the ST series.

| Do you own the rights to the Atari incarnation to GEM, such that you can
| even do so?

See above.

| Can we at least have resolution-independency [...]?

The VDI is quite resolution independent. It's fairly simple to write
resolution independant code using the facilities of the VDI. Providing
similar facilities in the AES, however, is a harder job than you
realize (come with me, if you will, into the deep dark recesses of the
AES sources... MOOOhaHAhaHA...). Keep in mind, though, that the TT
supports six resolutions on one monitor. That fact says something
about what we are doing with the TT OS.

| Why does David Beckmeyer say that you have never shown
| any interest in incorporating his multi-tasking kernel into the ST? [...]
| why not multi-tasking for the TT if not older models?

I have exchanged mail with Mr. Beckemeyer, and it is my PERSONAL
opinion that Atari could do much worse than adopt his RTX
implementation outright for an ST based multitasking standard. RTX
works well, and includes a lot of what we need to multitask GEMDOS. It
does not support everything we need to support, however. I have not
seen statistics on compatibility of GEM applications (although I know
that BDT has made an attempt at allowing GEM multitasking with the VSH
manager).

Atari will not release anything less than a thoroughly robust, compatible
multitasking OS. You _will_ see multitasking on the TT someday. I make
that statement with considerable wailing and gnashing of teeth... I do

NOT want people coming out with "Where's the multitasking? Where's
the multitasking?" It is regrettable, but true: the more whining _I_
hear about a particular thing, the less inclined I am to work hard on
it. With encouragement, we may both get what we want.

| You are aware of it, are you not? Are there technical difficulties?
| Legal difficulties? Ego difficulties?

Yes, I use MT-C shell myself, but it's only a shell.
Legal difficutlies? Perhaps, but I'm no lawyer.
Ego problems? Absolutely not. If something works, and it's solid,
I personally have no qualms about "stealing from the best." ;-)

| If the TT is as fast as the '030 is potentially capable of making it...

The TT is fast. Quite fast. Trust me.

| will Atari release something like PC-Ditto
| on it, to provide (free of charge) MS-DOS emulation at (I'm guessing)
| XT-clone speeds?

MS-DOS emulation free of charge? Hmm... I don't think so. Please be
reasonable - if Atari provides you with something of value, don't you think
Atari should charge a FAIR price? I don't doubt that an MS-DOS engine
will appear from some quarter for TT, and it will probably perform very
well, but I don't see Atari giving one away.

| How about
| incorporating other, less drastic improvements -- such as the executable-
| compression scheme used in products like PACKER and DC SQUISH?

From what I understand of how these programs work, it really isn't
necessary to ROM anything to support compressed executables. As is
demonstrated by their very existence, it's fairly straightforward
to pull off such a thing with the existing OS.

| Or the palette-switching scheme used by Spectrum512 to get the full
| hardware palette of 512 colors on a single screen -- could ANTIC
| Software (or whomever owns the technique) be persuaded to liscense it
| to developers? Do they already?

I don't know whether Antic licenses the Spectrum graphics kernel or not.
If they don't - I agree with you, they should! As you point out, though,
this is a software type of thing that is best accomplished in a runtime
library.

It will be possible with TT to make some very interesting new graphics
modes available. But because of the flexibility of the new video
system, it would be very hard to please all of the people with ROMmed
code. Atari supported software library routines are a valid
alternative.

| How about collecting
| some of the best public domain widgets, cleaning them up (to give them

| coherent user-interfaces, if they have such) and distributing them on
| an extra disk or two to new owners?

I think this sort of thing is much better accomplished by dealers and
user groups. Atari could never hope to provide the level of localized,
caring support which dealers and user groups can. Most user groups have
extensive PD library collections. Many offer the collections for sale
via mail, at a nominal price.

There is a company associated with, I believe, Paradise Computing, which
is working on a PD CD-ROM disk that contains hundreds of titles.
We are working with them to make this disk available.

| At least a RAM disk would be nice
| -- is that a feature of the TOS 1.4 release, by the way? Wouldn't it
| be fairly easy to add a new device for a RAM disk to TOS, so that, for
| example, formatting the "Z:" drive or some such would create a RAM disk?

No and no. MetaDOS, the extension to GEMDOS which allows device drivers
for such things as the CD ROM, would be hampered by such a scheme. And
as I mentioned before - application software does not belong in the
operating system. There are a wide variety of PD, shareware, and
commercial RAMdisks available, and they all have their plusses and
minuses. We could not hope to please everyone with our own RAMdisk
system software - there are much more important system software issues
being dealt with at the moment.

| Can we ever expect to see the 6-desk-accessory limit lengthened [...]?

I'd like to see more desk accessories available myself. When the AES
multitiasks, the definition of a desk accessory is going to become
rather fuzzy. In the mean time, there is MultiDesk, from CodeHead
software, which allows you to use a virtually unlimited number of desk
accessories.

| Are TOS and GEM in "maintenance, we-won't-touch-it-until-it-bites
| mode"?

TOS is in a constant state of flux. Hopefully we are successfully
combatting entropy, and making it better as it goes. And Atari has
recently released the Rainbow TOS upgrade.

| Is Atari planning to do anything with its CD-ROM player, [...]
| will Atari release anything on CD-ROM, or is it a box waiting
| for applications?

CD-ROM development systems are available now to registered developers.
The cost is $420, which is quite a deal, considering what you get.
Contact Gail Johnson at Atari if you're interested. The CD-ROM is
a box waiting for applications, which are being worked on by several
developers.

| Shouldn't Atari do something in the way of promoting recommended
| standard methods to do things like printer-drivers, visual appearance

| of GEM dialogues, etc?

Yes. We do have a printer driver construction kit for GDOS printer drivers - it is available to registered developers. Again, contact Gail Johnson for information.

Visual appearance of dialogs? I would prefer to see a consensus from the developer community on an issue like this, rather than a decree from Atari declaring "Thou shalt...". But Atari should and will take an active role in any such standards creation.

| Are the STE and TT European machines, or will we ever see them here
| in the U.S.?

You will most assuredly see STE and TT in the US. Sam Tramiel said in his latest live GEnie conference that STE and Stacy will be shipping in the US in October, and TT before the end of the year. STE is already for sale in Europe - notably in France, since they we lost a good deal of inventory there when Atari France burned to the ground last month. But there are dozens of variables in production, distribution, marketing, sales, dealer network... It's best not to ask "When?" too much. Atari is doing its best to get the new products to the dealers in a timely manner. The best answer is that they will be available when they are available.

| When can we expect to actually be able to walk into an Atari-
| authorized dealer (assuming any still exist in the immediate area) and
| see one, let alone consider buying one?

I just said don't ask when! ;-) Really, "when" is the hardest question to answer when it comes to Atari products in the US, for the reasons I mentioned before.

| Will Atari advertise either machine in this country, in magazines, say?

Absolutely. I forsee an agressive advertising policy towards the new machines. Sam Tramiel said as much in his last live GEnie conference. But don't ask me when. <hehe>

>
> I have an Atari 1040ST. I want a hard disk. I don't want to
> spend lots of money. I want lots of Megabytes. Lots.

(rest deleted)

With an ST, there are 3 basic things you need:

1) Hard disk - you can use EITHER a generic ST506/412, or sometimes referred to as as a PC hard disk, OR an SCSI drive. The main difference is that the first has no controller built in. The second already has the needed SCSI controller.

2) controller - if you use an ST506/412 drive, you need a SCSI controller. There are a few different kinds, but the Adaptek 4000 series is probably the best. Most controllers will let you hook up two hard disk mechanisms, which is an advantage over a hard disk with an embedded SCSI controller. However, you have an extra PC board to mount. If you want to expand your drive later, a separate controller is the way to go.

3) ST interface - goes from the controller to the ST. Berkeley, ICD, and Supra make such interfaces.

My personal preferences for each item:

1) Seagate hard disk mechs. They are recognized as the best.
2) Adaptek 4000A controller. Quite popular from what I gather. There is also the Adaptek 4000 controller, but this older version will NOT support removable media hard disks. However, the 4000 is cheaper.
3) ICD Host Adapter. I like them, and everybody I know uses one.

I recently put together a hard disk for my father. Got a Seagate ST-225 20 meg hard disk, Adaptek 4000 controller (NOT 4000A), and an ICD Host Adapter. Put it in a PC/XT case, used a PC power supply. Cost him $350. Considering Atari wants $200 more for their 20 megger, the savings is quite large.

You will also need 3 cables. First, you need a 20 pin card edge -> header to go from the hard disk to controller, a 34 pin card -> card to go from hard disk to controller, and a 50 pin header -> header to go from the controller to the ST interface. The interface will come with the 19 pin DMA cable. If you get a drive with an embedded SCSI controller, you only need the 50 pin cable.

Hope ALL this helps.

There is an ST VI editor called STEVIE. It's latest version (I think)
is 3.44. I have TRIED to use it, but it constantly crashes on me. The
cursor control is the culprit. I run a BBS, and I have tried to use
this to edit text files. I always end up rebooting after it crashes and
using WordPerfect instead.

If anybody knows of any other VI editors that DON'T crash, please let me
know!

MWC (Mark Williams) will probably upgrade as soon as the ANSI draft proposal is adopted. They already publish an "ANSI C" manual which contains everything in a lexicon format (sorta like their regular C manual). They are ready to go as soon as it is passed.

Does anyone know if any major (or minor) changes have been included in the draft proposal? The MWC manual is copyrighted 1988 and I was wondering if it would still be worth buying.

The ST reads IBM floppies (720K) without difficulty. I routinely
transfer files to my ST by writing them to a 3-1/2" PC drive and taking
the disk home. But the IBM systems will not read disks formatted on the
ST unless you use a special formatting program.

I have a VI for the ST that works fine. I don't recall whether I have
the documentation, and I don't know who wrote it, but I have been using
it for a while and it is fine (I usually run it from Gulam, but it works
from the desktop too).

If no one else has the complete package, I can look for the
documentation and either mail it out or repost, depending on the amount
of interest. But perhaps one of the archive sites has it?

Chris Freemesser wrote some good stuff about hard drive assembly, and mentiones
cables in passing. I know that cables used to scare me. No reason to worry
about building your own, as long as they're fairly simple and you can get
the end connectors. Ask the nice man at the electronics store (even R S).
Crimp pins are easy; ribbon terminators are even easier.

The public domain GNU C Compilier already supports the ANSI standard.
It's available from dsrgsun.ces.cwru.edu (129.22.16.2) by anonymous
FTP. The major drawback of the GCC is that it needs a lot of memory;
1 megabyte is the absolute bare minimum, 2 megabytes is a more reasonable
amount.

In my experience, TOS 1.4 correctly formats 720K IBM PC format floppies.
I've transferred files using an Atari formtted disk with problems.
It's kinda neat... ;-)

Just curious, since I'm transferring Atari ASCII files to an IBM,
and they come out just fine, how much of EBCIDIC (sp?) maps to
ASCII (I assume a PC uses EDCIDIC, no?)

--Kenneth "kens" Soohoo (soohoo@cory.Berkeley.Edu)

A small correction. IBM's will read TOS 1.4 formatted disks as TOS 1.4 uses the right IBM boot-sector. IBM can read old disks too, but then you need Avant-Garde's PC_DDRVR.SYS installed on the IBM i CONFIG.SYS...

Just got back from atarifest at fairfax high school in Va, and had the oppurtunity to see some interesting stuff. I didnt stay long.
Dave Small had GCR's n sale and was showing it off on his Stacy which I think is great for its price. The stacy he had, had a 40meg HD and a label "STACYA". anyway, DC software was there, and they had a demo of their new desktop "NEO/GOGO" deal, not completed but it looked good.
A decent amount of dealers were there, good prices on the ICD stuff.
Codehead, FaST tech(ICD), BEST electronics.
their mouse is excellent, but the Visionary mouse is even better. Checked both and bought the BEST mouse becuase it was cheaper.
Toadfile was being sold, decent deal.
CUrrent Notes/ Alpha Microsystems/ Lantech/and others were there.
It was crowded.
They had Portfolio's. its nice but I dont think it'll rasie my level of productivity.
The guy who rigged the 19inch moniterm had dveloped a card for one of those Multiscan 19inch monitors.
I stayed away from the Game room and the Ms-dos room(no interest here)
There was minor price gouging, nothing serious.
Michtron had Pc-speed but no demo.
and I waited around for Sig Hartmann to speak. he gave some drivel about him resigning because the Stacy didnt' ship by the end of September.
Lynx will ship within a month, TT will be shipping by the end of the year.
Portfolio's are sellign well, and he landed a major bank in the NYC area for DTPsystems.
Some stuff about advertising, nothing specific.
on the whole, my three hour tour was good.

I have been thinking of sending in my upgrade card but have been hesitant since I haven't heard of anyone verifying its existance. But......of even greater interest I just came across another hardware mod for the ST called PC Speed and it is being sold by Michtron. It is REAL and I have seen it for sale here in good old New Jersey. It is said to have a Norton SI rating of over 4.0. A friend has one installed and has found anything yet that does not run. He is using it with TOS 1.4 and says it is fa----st.

Installation is fairly simple, but does require soldering one socket on top of the 68000. The hardware board plugs into this socket. The real nice thing about it is that it is real and available. Its list price is about $100.00 above the list price of PC-Ditto II. That is $399.00. It appears to be being made in Germany, but I am not sure of its popularity there. Has anyone else heard of it?

Nope, only *big* IBM dinosaurs use EBCDIC. PCs use ASCII, like the rest of the modern world.

Too bad PCs can't read disks formatted for 10 sectors per track. I thought that was what the silly BIOS parameter block was for, but DOS is too stupid to understand what's written there... But yeah, it's handy to get 720K at a shot.

I've got a NeXT cube in my home now. I'm working on getting a TOS file server running on it, so I can get files back & forth to my Mega faster.

1408. Hard Drive Summary

Newsgroup: comp.sys.atari.st
Date: 1989-10-08 01:23:37 UTC
From: scott@CIE.UOREGON.EDU
Message-ID: <8910080123.AA17848@cie.uoregon.edu>
Source record: 248479

Here's a summary of what many have written me and what I've
learned from it.

MAKING HARD DRIVES EASY

(for the Atari ST)

The Atari is a wonderful computer with a DMA port on the rear
that holds the promise for incredible data transfer speeds. While
IBM PCs must clunk along using their 4 MHz CPUs to handle the data
transfer, the Atari's DMA has direct access to memory and is not
hampered by CPU speed. This means that we Atari owners can really
take advantage of the speed hard drives offer.
There are some companies making hard drives just for the Atari,
but unfortunately the prices are high and the options few. This is
what I shall try to remedy here by telling you what I've learned
about putting together your own hard drive to meet your needs
affordably. A few days ago, I knew nothing about hard drives. Now I
feel comfortable about putting together my own. That is how easy it
is to learn. (disclaimer: I don't mean that it is easy to actually
put together; I haven't done that yet. It's easy to learn _what_
to put together.)
There are three basic components to consider when making your
hard drive: the hard disk mechanism, the hard disk controller, and
the host adapter. I'll discuss these three first and then go on to
talk about the extras, e.g. case, power supply, fan, and cables.

HARD DISK MECHANISM: This is the heart of your hard drive. It
consists of platters covered by a magnetic media sealed in a metal
case with various muck a muck electronic stuff. There are basically
two standards to consider: MFM (Modified Frequency Modulation) and
RLL (Run Length Limited). MFM is an older standard of formatting that
allows for 17 sectors per track and RLL is a newer standard that
allows for 26. (RLL is also faster because of this) RLL requires
better quality disks than MFM, so when a disk is labeled as MFM or
RLL, that just tells you the quality of the magnetic media on the
disks. (There are other standards such as ESDIC, but they are not as
important for us.) Another measure applied to disk mechanisms (besides
their capacity) is their seek speed. Usually measured in milliseconds,
ms, this is the time it takes for the heads to move to a new track and
settle-- the lower the number, the faster the drive.
Two companies were recommended to me more than any others:
Seagate and Miniscribe. Seagate is my choice though because it is
well known and common. Some complaints about the two were that the
Minscribes are very noisy and prone to break down, and that the

Seagates are very hot when they operate. (be sure to get a fan.) A note of warning here: some hard disk mechanisms come with an "embedded" disk controller, notably the Seagate series with the "N" suffix, and many of these embedded controllers are buggy. (The Seagate "N" series have/had a bug where they won't accept commands just after finishing a previous command making it necessary to slow the whole schmear down a lot.)
Examples of hard disk mechanisms are:

Seagate ST-296-N (84.9Mb, 28ms, SCSI): This is a hard disk mechanism that can seek in 28 ms, holds 84.9Mb, and, note the "N" suffix, has an embedded hard disk controller (SCSI type). This "N" series won't work at full speed I'm told.

Seagate ST-277-R-1 (65Mb, 28ms, RLL): This one can seek in 28ms, holds 65Mb, and, note the "R" in the name, is good enough for RLL format, and doesn't have an embedded hard disk controller.

Miniscribe M3650 (42Mb, 45ms, MFM): This one can seek in 45ms, holds 42Mb, and is _not_ good enough for RLL format; it must be used with an MFM hard disk controller.

Miniscribe M3675 (64Mb, 45ms, RLL): This one can seek in 45ms, holds 64Mb, and is good enough for RLL format; you can use an MFM or RLL hard disk controller. (You just lose capacity if you use an MFM hard disk controller)

HARD DISK CONTROLLER: This is the device that takes the SCSI commands (I'll only consider controllers that do take SCSI) and actually makes the hard disk mechanism work. There are basicaly two types to consider: MFM and RLL. An MFM controller takes SCSI commands and works with the hard disk mechanism in MFM format, while an RLL controller takes SCSI commands and works with the hard disk mechanism in RLL format. (An MFM controller can use RLL hard disks, but just can't make full use of the quality the disk offers, so you won't get the full capacity. An RLL controller can _not_ use MFM hard disks, they simply don't have the quality needed.)
Different controllers offer different features in addition to the basic work horse stuff. Some can work with removable media hard disks (the neato ones that use cartridge things), some can chain many more disks to the same controller, etc.
Some companies that make controllers are OMTI and Adaptec. The overwhelmingly popular controllers are from Adaptec. Here is a partial list of what I believe they offer:

Adaptec 4000: This is an older MFM controller that can be bought cheap. It can't handle removable media, but it can handle two hard disks from the same controller.

Adaptec 4000A: This is a later version of the 4000 that can handle removable media.

Adaptec 4070: This is an RLL controller. I think it can also, like
all Adaptec controllers (?), handle two drives from the same controller.

HOST ADAPTER: This is the key to allowing your Atari to speak
SCSI. The Atari DMA is very similar to SCSI, but not enough for SCSI
compatibility. A host adapter takes care of that by being a translator.
Three companies offer good adapters: Supra, Berkeley Microsystems
and ICD. However everyone I've talked to agrees that ICD is the way to
go. Supra has a bug that limits how far away you can have the hard disk
from the computer, while ICD doesn't and allows you to do read verifies.
I believe the ICD adapter can chain up to eight controllers and also has
another DMA port connection, so you can connect your laser printer or
whatever.

OTHER STUFF: Cables are a definite must to connect all the above
together. I'm not too sure about what kind are needed, but I'm sure
the literature you get from whoever sells the hard disk, the controller,
and the adapter will tell you what you need. I'm told that you need a
20 pin card-edge to header, a 34 pin card to card, and a 50 pin header
to header, but don't take my word on it.
A power supply is another must. At least 60W is recommended. Many
hard disks draw lots of power to start up, and if you expand later it's
best to have a power supply that can handle the job. Some people even
recommend 150W. (I guess they're cheap when bundled with an IBM case.)
After the all the above is set up and connected, you should have
a working hard disk, but many hard disks are hot running and could
overheat and many people just don't like to see all that stuff scattered
around on the desk, so a case and fan are good investments. These and
the power supply are very easy to find cheap. Many people just buy an
IBM PC case with power supply and fan all ready to go.

I'll now present some sample collections of hard disk, controller,
and adapter:

(Seagate ST-296-N) + (ICD host adapter)
This combination doesn't require a controller, because the Seagate
ST-296-N has an embedded controller. Because of the bug in "N"
series Seagates, this setup has to be slowed down to work. Also,
you couldn't just add another hard disk (unless it had an embedded
controller) without buying a controller.
($459 drive, $116 adapter)

(Seagate ST-4096) + (Adaptec 4000) + (ICD host adapter)
This combination is a fast high capacity (80Mb 28ms) system that
will easily expand by just plopping in another MFM hard disk
mechanism.
($520 drive, $110 controller, $116 adapter)

(Seagate ST-277-R) + (Adaptec 4070) + (ICD host adapter)
This combination is a fast high capacity (65Mb 28ms) system that
will easily expand by just plopping in another RLL hard disk
mechanism.
($349 drive, $125 controller, $116 adapter)

(Miniscribe M8450) + (Adaptec 4070) + (ICD host adapter)
This is an average (40Mb 45ms) RLL system that can be expanded
easily too.
($269 drive, $125 controller, $116 adapter)

(Seagate ST-225) + (Adaptec 4000) + (ICD host adapter)
This is a low end (21Mb 65ms) MFM system that can be made cheap,
but is still just as expandable as the rest.
($187 drive, $110 controller, $116 adapter)

(All drive prices from various ads in _Computer Shopper_.
controller and adapter prices from ad for D&P Computer in
Current Notes Jan/Feb 1989)

So in summary, it would appear to me to be best to go with the
ICD host adapter, the Adaptec 4070 disk controller (RLL), and
some RLL type hard disk.

One company I find noteworthy here is Toad Computers. They sell
the ICD FA-ST hard drives, which use the ICD host adapter and,
I believe, the Adaptec controller and a Seagate hard disk.
Looking at their ad in _STart_, Sep 89, I see an 85Mb 28ms hard
drive for $739, a 20Mb 65ms hard drive for $499 and others
between that.

ADDRESSES:

Current Notes, Inc.
122 N. Johnson Rd.
Sterling, VA 22170
(703) 450-4761
(a very good ST mag for $24/yr. Vol. 9 No. 1 has a good
article about hard drives.)

D&P Computer
P.O. Box 811
Elyria, OH 44036
(216) 926-3842
(This company has lots of ICD and Adaptec stuff and cases
and such.)

Toad Computers
556 Baltimore Anapolis Blvd.
Severna Park, MD 21146
(301) 544-6943
(Absolutely the best buys for hard disks that I've seen.
They sell the ICD FA-ST hard drives.)

ICD, Inc.
1220 Rock St.
Rockford, IL 61101-1437
(815) 968-2228
(ICD makes the host adaptor that most people use. They also
make the FA-ST hard drives and other stuff.)

DISCLAIMER: I am in no way connected to any of the companies mentioned above and I make no guarantees or assurances that any of the above is true, useful, or safe, except that it can be used to decorate a paper airplane.

1409. Atari VT52 accessory...help!

Newsgroup: comp.sys.atari.st
Date: 1989-10-08 01:27:33 UTC
From: ehsnsr@JUPITER.NMT.EDU
Message-ID: <8910080127.AA00912@jupiter.nmt.edu>
Source record: 248480

I am a two-and-one-half month new user of an Atari STfm. The VT52 emulator that came with it puzzles me. This may sound like a trivial question to a ST experts out there, but what does this accessory do, and how do I use it???
What is it capable of?

I have no manual for it so any responses would be greatly appreciated.

>Just got back from atarifest at fairfax high school in Va,
>The stacy he [Dave Small] had, had a 40meg HD and a label
>"STACYA".
^^^^^^^
Actually, "STacy4" was on the label. 4Mbytes!
Yow! Nice portable! Room for two drives, one of them a hard disk, even.
NICE keyboard, readable screen. Hope Atari is actually able to sell them.
Another portable? And not even MS-Dos compatible? <shudder>
Price? Sandy Small was saying probably < $3000, Sig Hartmann was
saying "Reasonable."

>their [BEST] mouse is excellent, but the Visionary mouse is even better.
>Checked both and bought the BEST mouse becuase it was cheaper.
Wonderful. I suppose you bought the BEST Macintosh emulator because it
was cheaper than the Magic Sac.

>It was crowded.
It was crowded, and they had an extra room for dealers, although it
was a rather less crowded in there than at the main room.

>The guy who rigged the 19inch moniterm had dveloped a card for
>one of those Multiscan 19inch monitors.
I missed this -- could you post the information, if possible?

> -Ajay CHoudhri

Well, beyond what Ajay saw, I talked to the rep for Gribnif Software
for a while, and they'll soon have new versions of NeoDesk for different
countries and languages. Some of these are completed already. I forget
which; I've already got my copy. 8-)

I liked the 19" Moniterm. NeoDesk certainly seems to support it.
Too bad I don't have $2000 lying around which I'm not using for
tuition or food.

My main gripe, aside from the presence of BEST, is the door prize
system -- "If you do not pick up your prize within 15 minutes, it will
be forfeit." Ah, well, it was an interesting fair nonetheless.

1411. ST SURVEY Update.....Soviet-bloc users wanted if existing...

Well,

2 weeks have gone by since the ORIGINAL request for information
regarding ATARI prices/products has gone out.

Since then, replies have been received from:

USA: Arkansas Univ.
Columbia Business School, NYC
Cupertino, CA
Michigan
and a few other states.....

EUROPE:
Norway
Sweden
France
England
Switzerland
The Netherlands
and a few others that escape me now (3:05am)...

I would * R E A L L Y * like to hear from some ST owners/users
in Soviet-bloc countries if there exist any!!!

In the meantime, I STILL WANT TO HEAR FROM SOME MORE ST USERS!!!

^^

Also, if ANYONE has ANY information on ANYONE ELSE who programs
in the S.T.O.S. programming language for the ST, please send me E*mail!!!

>1) Is there any way to get a 1040ST (TOS 1.4) to use HD (1.4M) disks? I
> tried to format one and the machine refused. (Gave the same error as
> when you try to format a write-protected disk.

Yes. It is possible; it requires hacking the hardware:

1.4 Megabyte drives use 300 rounds per minute rotation speed and a 500
kBit per second data rate; twice the data rate/density as the regular
drives do.

If You get a HD drive (TEAC FD135 HFN for example) and wire it up to the
ST, it will work just as a 720 k-drive, cause the controller chip is
still fixed to 250 kBit per second.

We have to speed up the controller; looks easy: the controller manual
says all time constants of the controller are take from its 8 MHz clock.
If we would just switch it to 16 MHz?

That is, what I have done to my ST. I use the 16 MHz output of the
SHIFTER as clock source and switch the controller clock between 16 and 8
MHz based on the High-Denity-Enable output of my TEAC FD 135HFN (Shugard
BUS pin 2).

It works fine, if the step-rate (the time between 2 consecutive Step
pulses sent to the drive) is set to 6 milliseconds. The controller will
now step every 3 milliseconds (since we doubled the his clock) in HD
mode, and every 6 milliseconds in DD mode; this does not hurt the drive
or performance too much.

I have some problems with it: no program will load from HD disks and
access to folders does not seem to work too well from DESKTOP.
Everything works fine from msh, as far as I can tell. Even copying files
from HD to DD disks (DD disk in drive B; not tested for single drive
copy) works fine.

All we still need is the software to set the step rate to 6 milliseconds
and to format a drive with 18 Sectors per track.

Here ist goes:

seek6.s: set seek rate for all (both) drives to 6 milliseconds
/ module name seek6

No.
Even Mama Blue is (sometimes) willing to adopt to standards, even when trying to set them. First, they used ASCII for the PC, now the gor for UN*X (AX for PS/2, RIOS and VM370 will come "real soon now"! They are still tying to make the 286 act like a microprocessor...)

The Pissi uses some sort of extended ASCII. The ST extends this table further.

I think your Lharc needs updating. I extracted this file without problems
in my PC/At with Lharc v1.13c. Perhaps this same is to Atari. I remember
there are two versions of Lharc to Atari as well.

David, has Levee been fixed yet? I like it a whole lot (most complete features set I've seen on an ST), but I can't use it if pressing a key during scrolling is going to crash the program and lose everything. I just can't count on my habits changing to avoid this, so I've been using Emacsen (sigh) - they force me to think differently. Let us know ...

1420. Avant-Garde's PC_DDRVR.SYS

Newsgroup: comp.sys.atari.st
Date: 1989-10-08 20:27:42 UTC
From: silvert@cs.dal.ca
Message-ID: <1989Oct8.202742.10601@cs.dal.ca>
Source record: 248491

Lars-Erik Osterud recently pointed out that you can use
Avant-Garde's PC_DDRVR.SYS to read normal ST disks on a PC.
This works fine, and I just wanted to add a comment on how bright the
software is -- my NEC Ultralite installs a RAMdisk as drive C, and the
driver routine (which normally creates logical drives C and D) spots
this and creates logical drives D and E as ST equivalents to A and B.

There is a noticable change in performance, since if I run DIR B: on a
PC disk the display scrolls smoothly, but if I run DIR E: on an ST disk
(in the same drive) the display jerks by. But that is pretty minor I
suspect. I haven't yet tried editing an Atari WP file on a PC!

I'm a bit hesitant to try this trick on the monster I have at work,
a 386 with three floppy drives and five HD partitions -- will
PC_DDRVR.SYS duplicate all three drives, just the one 3-1/2" drive,
or what? Anyone have any ideas what the side effects might be?

From: jlong@blackbird.afit.af.mil
Message-ID: <1379@blackbird.afit.af.mil>
Source record: 248494

I have Prospero-C and it is "...a complete implemention of the proposed
ANSI standard for C for use on the Atari-ST range of computers"
(quoted from the back of the box it came in)

It is a very complete package, comes with a debuger and a nice gem based
shell to work from. I used it to port some IBM stuff written for
Turbo-C V2.0 (Bibtex V0.99c) and the port was almost trivial!!
It has excellent documentation (almost 1000 pages in 4 separate spiral
notebooks) and is very robust, I haven't had a single crash from the
shell yet! The only real drawback with it is that it isn't exactly a speed
demon!! But it runs fine on my 1meg machine and hard drive
I recommend it to anyone with only 1meg and who wants a 100% ANSI-C
compliant compiler :-)

No, I don't work for them (see signature block :-))

I have seen reports of problems accessing harddrives after installing TOS 1.4. I just wanted to say that this maybe a problem with the formatting or boot utility being used. I just installed the new ROM's into my Rev. D 1040STF and had no problems with my 1985 Supra 20Meg HD. I am able to access everything properly and my previous backups could be restored properly. I use Supra Utilities V2.62 and Meg-A-Minute Elite by Small etal. for my HD utilities. Someone with more know-how might want to check this out. Just thought I'd put in my $0.02 worth.

Aaron the Alchemist
Charlop@uwachem.washington.edu

"Yes I really am an honest-to-goodness Alchemist" Me

P.S. Why didn't Atari include a Move option in the copy routine?

>
>Are you out there trb?!?

Yes,
I am out here...I still haven't gotten around to sending folded off to the source and binary archives yet. Too many tie-ups at work lately. I'll try to get everything moved over to my Unix system and 'shar'ed together for release in the next week or two. The version that I will be sending out is 0.9e and is the version I have been using on Unix and the IBM PC for the last three months without any glitches. I haven't powered on my Atari ST for several months now, but I imagine that the ST version is fairly bug free as well. Sorry for the delay...

1426. Re: official tos 1.4 release

Newsgroup: comp.sys.atari.st
Date: 1989-10-09 01:10:11 UTC
From: charlop@blake.acs.washington.edu
Message-ID: <3958@blake.acs.washington.edu>
Source record: 248497

A quick question.

Where does one find the patch program for the serial port bug?

I am at home trying to do some work over the modem and I keep getting
spurious characters and commands being sent out. In fact it has made reading
the net almost immpossible. Just a few minutes ago it even unsubscribed
me from this topic.

PLEASE HELP ME.

Message-ID: <2842@jhunix.HCF.JHU.EDU>
Source record: 248498

How to draw a cursor:

Cursors are real easy. All you have to do is draw them in with v_bar,
but first set the write mode to XOR (vswr_mode(handle,3)) so that
you wind up with a black cursor over a white letter. When you're
ready to undraw the cursor, just set the write mode back to XOR (if
you changed it in the first place) and draw the same box over again.

>a shot.

I think there is one possible way worth trying this. There is a program called
FDFORMT2 for PC that allows one format a disk with many various parameters.
And this program comes with memory resident program that allows (certifies)
a machine to read such disks. I have successfully format in my AT with this
program normal 360K floppys to 832K and 1.2M disks to 1.49M. You can find
this program with ftp from address below.

I would like it if Portfolio specific issues were kept out of the ST
newsgroup. I am interested in the Portfolio as far as it concerns Atari's
marketing and development directions, but I am not interested in the
Portfolio as a machine.

This is certainly no worse than ST or Amiga owners buying Macintosh ROMs for
Spectre or Amax. What makes the ST specially inviolate?

However, there hasn't yet been any evidence that this ST emulator for the
Amiga actually exists, anyway...

1433. Deutsch online

Newsgroup: comp.sys.atari.st
Date: 1989-10-09 12:58:26 UTC
From: MEGGIN@vm.epas.utoronto.CA
Message-ID: <8910100703.AA06208@ucbvax.Berkeley.EDU>
Source record: 248404

A friend of mine, a fellow Old English scholar and ST user, has asked me if there is an online German dictionary available for the ST. She would be interested in either a desk-accessory (to run inside her wordprocessor), or a separate application (not as useful). This would have to be, of course, a German/English dictionary, although a purely German dictionary might be helpful.

She is also interested in any software that will help her learn German. I have seen a program to teach Spanish verbs, but nothing for German so far. I look forward to hearing from the large German ST user base. Please reply directly to me, since I am not actually on Usenet.

1434. Federated software sales

Newsgroup: comp.sys.atari.st
Date: 1989-10-09 14:14:55 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891009.08145435.065625@SFA.CP6>
Source record: 248405

I'm not sure if this is old news or not, but it may be of benefit
for those who do not know.
The Federated stores in the Houston area are running some incredible
sales on ST software. I managed to pick up the entire INFOCOM series
for the ST at $1.96/package. Note that the articles for sale are in the
older boxes, that is, the good ones (!). For example, Hitchhiker's Guide
to the Galaxy is in the large box, complete with Fluff, sunshades, "Don't
Panic button, etc. These are not in any of the newer packages.
I was also able to find a lot of older and GOOD software that is no
longer made for the ST. Sort of sad, like reading a time capsule's contents.
These even had warranty cards for them. Lots of Holms and Duckworth
utility programs.... Lots of software of the 1986 era, also, when things
were exciting for the ST at the local market.
At any rate, all appear to be new boxes, in other words, not rewrapped
or reshrink-wrapped. All were cheap. I blew $26.00 on twelve pieces of
software.
So, if there are any Federated in your area, you might check them
out. We went to this particular Federated by sheer accident not knowing that
it was holding the clear-out sale.

Source record: 248407

This is in reply to a whole bunch of *ABSOLUTELY*WRONG* messages about exchanging disks between Atari ST-s and IBM PS2 machines. A PS2 will correctly read from and write to any disk an ST can format so long as the boot sector doesn't lie about the format, and so long as the first 3 bytes of the boot sector are EB 34 90 (that was 3 bytes of hex, people). If you copy an IBM boot sector to a floppy with a format different from that described in that boot sector it will crap out. I ROUTINELY put the 3 magic bytes at the start of disks formatted with TWISTER and use them on PS2s. Don't bother flaming me for getting fed up, just fire up DRFLOPPY or MEMFILE (or even a PS2 sector editor) and TRY IT.

In article <10085@xanth.cs.odu.edu>, src@cs.odu.edu (Scott R. Chilcote) writes...
"
" I opened my Mega 2 last week to install TOS 1.4, and discovered a TRULY
"AMAZING thing. The machine had a complete set of RAM chips, a total of
"FOUR MEGABYTES worth, installed!!
"
" <etc>
"
" So, for the cost of soldering one pin of one IC to the motherboard, I
"have a FOUR MEGABYTE computer!!
"

My guess is that this was a Mega 4 that didn't pass the checkout.
In the same way that chip makers sell slow chips at slower specs,
Atari is probably selling Mega 4 fallouts as Mega 2's. It's
probably cheaper for them to give away the chips than to repair
the boards (on the average). So you got lucky!

chris

Well, I can be reached at .../gtephx!covertr. FORCE is a node on our
Apollo network. Just try gtephx!covertr.

>
> You suggest that Atari go ahead and produce updated TOS 1.4 ROMS. This is
> probably a bad idea. Can't you just see customer service: "I have this
> problem", "What version of TOS are you running?", "TOS 1.4, I just bought
> it from my dealer", "Which one, new TOS 1.4 or old TOS 1.4???"

Greg, the problem is one of timing. By the time Atari got the TOS 1.4 PROMs
out, and notice that they are PROMS not ROMs, bugs had already been identified
and repaired by hackers. Since, the offical TOS ROMs still haven't been released,
it is not unreasonable to hope that Atari would fix the known bugs before releasing
them. I just hate to see TOS 1.4 start off with a bunch of auto folder patches!!
And there is still no legal way to buy TOS 1.4 in 100 ns EPROMs so that the
Turbo16 can run at full speed. T16 can be setup to access the TOS memory without
wait states if the memory is quick enough. Hence the need for 100 ns EPROMs.
If Atari was selling TOS in ROMs it might be possible to buy them in 100ns
roms. who knows??

>
> Or, a user sees TOS14PATCH.ARC on his BBS, and wonders if he's

Greg, the user already needs an auto folder patch for the TOS 1.4 that is being
sold by Atari. How many more patches will be needed over the next six months??

>

>
>
> ------
> Greg Lindahl
> gl8f@virginia.edu I'm not the NRA.

And finally, Greg, I have stopped asking Dave Small for a 300 dpi QuickDraw driver for the SLM804. As you have just said it appears to be too hard for Dave Small, or anyone else, to develop. So, whose fault is it?? Atari?? Apple?? GBS?? All I know is that when I bought my Spectre 128 from Dave Small in Sept 1988, Dave said that he would provide a 300 dpi driver for the SLM804 laser printer. And now over a year later it has proven to be an impossible task. The best that Dave can do is 144 dpi, which is basically just draft printing on a 300 dpi laser printer. so, while I am not satisified with the Spectre printer driver for the SLM804, at least I know that Dave gave it his best shot!! So, I am NOT flaming GBS. I am just waiting for GBS to release the Spectre version 2.0 software so that I can use my SLM804 laser printer in 144 dpi mode.

1439. Serial port Disk driver

Newsgroup: comp.sys.atari.st
Date: 1989-10-09 17:03:48 UTC
From: paulm@ccicpg.UUCP
Message-ID: <42681@ccicpg.UUCP>
Source record: 248410

Hi:
I've been doing some drive changes on my ST latelly and been needing a backup system. I've tried turtle but I haven't loads of floppies that I can use for this nor the time to sit in front of my computer all day switching diskettes. What I do have is a couple of UNIX systems (one system V and one BSD 4.2) with lots of disk space and 5 1/4 cartridge tape drives. I then started to consider using the UNIX system but had to get the information to it some how. I thought of using xmodem but it also required some intervention. I've been writing disk driver code for a while (my MAXTOR 380 meg ESDI drive) and all of a sudden it flashed on me to just convert the actual I/O routines in the driver so that instead of going to the DMA port, it went via the serial port. I over came the non re-entrant BIOS problem and wrote a handler that runs on the UNIX system. I can create a disk file on the unix system from 128K to 16meg, start the TSR driver on the ST and Wella... I've got a drive 'P' on my st that I can just drag files or disk ICONS to and start the copy and go away for a while.
If used with a disk caching program this drive can be quite fast.
Well I've been reading this forum for quite a while and have downloaded a lot of great stuff. If anybody is interrested in my code I will post it PD on this net or (try) to mail it to whom-ever asks.
Currently I am working on another UNIX side utility to copy to and from files from UNIX and the ST disk file.

A very informative posting, Chris! Thought I would add my own experiences in...

In article <1381@ultb.UUCP> clf3678@ultb.UUCP (C.L. Freemesser) writes:
>
>My personal preferences for each item:
>
>1) Seagate hard disk mechs. They are recognized as the best.

These are your personal preferences -- please don't throw in lines like "They are recognized as the best"!

When I went to put together my own hard drive, the hard drive dealer steered me away from Seagate, because they had switched manufacturing plants, and the new drives were not reliable.

When selecting a hard drive, get the MTBF (mean time between/to failure?) figures. I have a Micropolous drive, and it should last twice as long as a seagate based on these figures.

I have read on the net of many unhappy Seagate customers (the ROM7/ROM8 contraversy)--it is unlikely that they would recognize Seagate as the best!

>2) Adaptek 4000A controller. Quite popular from what I gather. There
> is also the Adaptek 4000 controller, but this older version will NOT
> support removable media hard disks. However, the 4000 is cheaper.

I like the 4000A as well. I believe there is a controller called omni or omnti that is supposed to be very fast. If you have a fast drive, you might want to find out more. I think the fastest result is to get an embedded-SCSI controller drive, like the Quantum.

>3) ICD Host Adapter. I like them, and everybody I know uses one.

I went with a BMS-200. It worked for me.... I did have to get software that would support more than 4 partitions -- it seems that BMS didn't bother extending Atari's four partition scheme.

For me, the big win in building my own hard drive was speed! I have a 28ms 65 meg drive that also happened to cost much less than an equivalent 60 ms Atari drive!

>You will also need 3 cables. First, you need a 20 pin card edge ->
>header to go from the hard disk to controller, a 34 pin card -> card to
>go from hard disk to controller, and a 50 pin header -> header to go
>from the controller to the ST interface. The interface will come with
>the 19 pin DMA cable. If you get a drive with an embedded SCSI
>controller, you only need the 50 pin cable.

My BMS-200 came with all cables and some mounting hardware.

You still need some form of enclosure. If you buy a kit, like ICD's kit, make sure the drive(s) you have will fit the enclosure. ICD's kit will only take half-height drives. My drive happens to be a full-height. Not a flame against ICD or others, just be aware that there are different sized drives!

Some games work, some do not, and some work with conditions. QuarterStaff will work fine on a Mega 4 (only) even though it is copy-protected! The major consideration is whether or not the program was written to Apple guidelines and whether or not the software addresses any special MAC chips, is they do, forget it, if they don't you stand a good chance - especially if the is no copy-protection.

Peter Szymonik

I'm not sure about Mathematica, but I saw (and bought!) and great math utility program at the WAACE fest. Its called El-Cal and its by Debonair Software/J.Andrezej Wrotniak. A VERY powerful math program with fast calculation and superb graphing abilities with 16 digit precision. 36 standard functions, 44 disribution functions, function, histogram, and scatter plots (all this from the data sheet by the way), linear, square, and cubic equations, numerical equation solving, linear regression and correlation (W/ plotting), polynomial least squares up to the 6th degree. etc. etc. etc. and an EXCELLENT user interface - not an amateur job by any means - all for $40!!

All my doubts have been laid to rest. This weekend at the WAACE AtariFest
I SAW, and USED the STacy and the Portfolio. VERY solid machines, these
were not demo machines - they had a very sharp production feel. The STacy
I used had 4 megs of RAM and one internal DD drive - it was hooked up to
an external HD and a Spectre GCR - hence, Mac laptop! My only complaint is
that the screen was a bit dim even at the best setting and the refresh was
understandably slower than a standard ST/MAC screen. I was very impressed
with the construction and feel of the machine, it also looked quite impressive
in its dark black/blue case.

The latest I've heard on PC-Ditto II comes from Jim Allen, maker of the FAST Technologies 16mhz board and close friend of Bill Teal. PC-Ditto II is waiting for parts, most noticablly the ribbon cable with a special clip that attaches to the 68000. It was decided that the board would sell more if no soldering was involved, and so a custom ribbon cable with clip was designed. When? Soon... :-]

I haven't seen PC-Speed yet, niether have Dave Small or Jim Allen.
Their comments were that it was Germany, it was supposed to be good,
it does require soldering, and that they can't guarantee that it will
work with Spectre GCR or the FAST Technologies 16mhz board (in fact
I think Mr Allen said for sure that it wouldn't work with the accel board
because of the soldering connection.)

Image Systems has a sub $1,000 board for the ST that allows any multi-sync to be connected to the ST (if it is capable of running at 50 KHz horizontal and capable of the resolution.) It extends the color palette to 4,096 (vs. 512.) and has a 1,024x768 display with 16 colors (non-interlaced.) It also has a socket for a 68881 math co-processor.

>during scrolling is going to crash the program and lose everything.

Well, no, it hasn't been fixed, but that's cause I never run into the problem. ("problem" - that's a nice way to say "<censored> cheapo operating system bug") The only time I hit the bug in the last couple of years was a couple of minutes ago, when I made the system puke by loading in a 40k file and LEANING on the ^D key (and even then it was about 30k down before the shrooms walked across the screen.)

The easy solution would be to just eat typeahead, but I've a friend here who would beat me into a pulp with my keyboard if I was to implement such a fix. *sigh* one of those goddamn things that make me wonder why I didn't buy a Mac...

I'll figure out a "fix" and wire it into Levee this week.

Someone asked if MWC was worth buying although it is not ANSI and ANSI C is sure to be passed in the future.
The big point about ANSI C is that one compiler will run on another compiler with no changes in libraries, etc. ANSI helps clear up the points K & R were vague about and hence a cause for differences between compilers.
Now the way I see it is that MWC follows the ANSI C standard in spirit (I.e., Structures can be passed as a parameter rather than a pointer), and unless your code is going to have a wide distribution over different machines, you won't *absolutely* need ANSI.
I have been using MWC for about 2 years, and I have learned a lot about C as well as the Atari ST. I use it for my own purposes, and it is rare that I need to compile it on a different machine, as I use MWC for many Atari-specific programs. I think people holding their breath for ANSI are thinking "If I only had ANSI, I will be able to do *anything!*". That's what I felt like before I started writing "serious" code (i.e., big programs that did something useful, etc.). First I thought I *needed* a hard drive before I could get anything done, then I *needed* a time chip (for Make), before I realized I didn't actually need them to write a "Hello World" program.
You may actually need an ANSI compiler (Prospro provides one), but I think the vast majority of would-be Atari Programmers will do well to get MWC (or any other compiler), even if it doesn't have ANSI.

Why stupid? Good software takes time to write, and a decent commercial product can easily be worth more than $100.

ST users are lucky -- the machine is easy to program, and lots of hackers like it, so we get super freeware in areas like communications. For text, you have lots of variants on emacs.

But if you want the kind of applications software that people don't write for the fun of it, like dBASE and Lotus clones or desktop publishing packages, you have to pay a fair price. Fortunately this is usually a lot less than the MS-DOS or Mac versions.

The attitude that paying for software is stupid is probably one of the reasons that there is little commercial support for the ST.

> ...
> So you got lucky!
>
> chris

I originally suspected this, but there's no evidence to support your belief. The (now) Mega 4 has been operating flawlessly as a four-Meg machine for several days now. Also, the method by which the upper banks were disabled doesn't support the possibility of the machine ever having been intended to function as a Mega 4. When the RAS2* pin was left _unsoldered_, rather than clippied or disconnected, no test could have been made of the machine with all four Megabytes operating.

At this point, it seems that it must have been less expensive for Atari to make some machines with all of the RAM filled than to make two production runs separately, one for each size machine. In order for that to have happened, Atari must have either been WAY behind on Mega 2 deliveries, or have gotten a _very_ good price on 1 Megabyte DRAMs!

Scott

pc_ddrvr.sys is a TSR program supplied with PC-Ditto to allow ATARI
partitions D,E,F etc to be accessed from MS/DOS running under the
emulater. It has no other magical properties.

> problems using 100 or 80ns chips? Will things speed up if I use 80ns chips?
> (I'm planning on using 1M * 1 chips).

I bought an EZ Ram II about 2 years ago. They had just changed the board design and it didn't work when I received it. I had to return it twice before I got one that worked. They did refund all of my shipping charges.

Since then it has been working great. I started with the 256K bit chips and just recently bought the 1M bit chips. Still running strong, never misbehaves.

The ST can't make use of any speed increase in chips above 150 ns. EZ Ram II recommends 120ns chips however. I bought 100 ns ones, mainly because they are more reliable (and durn cheap now!). Not many places carry the 120ns 1M chips, and the 100ns ones are usually only a quarter or so more a piece.

It's great to have a 2.5 Meg machine :^)

Now a question of my own. Could I use my 256K bit chips I replaced in one of those cartridge RAM expanders every one is talking about on this board? Would I be able to have 3 Meg? Or won't it work with another expansion already in place? If it would work, how much are those carts with no RAM?

Have you tried ST Writer? It is not a WYSIWYG type word processor but is fast, well-supported, and is constantly updated. It can be found in STart magazine (I think).

"$100+ for any program is just plain stupid."

Why? Some of the better business programs may take a team of several professional programmers and many months of hard work. Where does the money come from for their salary and research costs? I don't like the costs either but we have to be realistic. If one uses a piece of software on a regular basis, then, philosophically, it is as if it was a piece of equipment such as a printer or disk drive.
STers still, in spite of the moaning over piracy, feel that software should be "cheap". Sorry for the slight flame but I fear for the ST's software development and research. Just my overly biased opinion....

> (quoted from the back of the box it came in)
>

Jeff Long, how complete is the GEM AES/VDI Library in the Prospero C compiler?? I am currently using Mark Williams C, version 3.09, but it isn't ANSI compatible, and isn't even all that UNIX compatible (no signal() for example).

Does the Prospero compiler have a rich set of UNIX style lib functions??

How does it handle floating point arithmetic??

Can it use the math coprocessor chip, if installed?? MWC doesn't.

How close to the draft ANSI standard is Prospero?? Is the processor compliant??

Where the heck is Prospero?? How good is there technical support??

How compatible is the Prospero compiler with the Laser C compiler?? Can I compile Laser C code with the Prosero?? I can't with MWC (different header files, libs etc).

To defend Mark Williams a little, while their C compiler is rapidly aging, MWC offers excellent technical support, including an 800 number. MWC responds to technical bugs quickly. I was having an interaction problem with PINHEAD which was causing the MWC Resource Editor to bomb. I called MWC to report that their RSC EDitor was bombing and they returned my call within a day. It turned out to be a problem with PINHEAD and not the MWC RSC Editor, but I didn't know that when I called MWC. And the MWC C ompiler manual is a goldmine of sample C code for GEM AES/VDI routines!! I am constantly referring to the manual!

So, I would be less then willing to drop MWC, but it would be great to have a ANSI C compiler!!

From: wao@cbnewsm.ATT.COM
Message-ID: <5216@cbnewsm.ATT.COM>
Source record: 248443

I am having several problems with my (DS internal) floppy drive. It seems that if I don't access the drive for several minutes it stops working. For example, if I double click on a folder the file listing becomes corrupt (the disk does not spin). If I pop the disk out and replace it, it works fine (unless I don't access it for awhile). I ran VKILLER 2.2 on my boot disk, no virus. By the way I have a z-time clock chip installed under one of the roms (ver. 1.2) with software in the auto folder to drive it.
Also, when I pop a disk out of the floppy drive the button pops out as if there is a disk still in it. In order to put in another disk I have to hold the eject button in until the disk is inserted.
How can I fix this!
Thank in advance
Bill Oswald

I remember thinking the same thing when I d/loaded STEVIE when it
came across a couple of months ago. The cursors were screwed up &
it crashed all the time.

After some digging around, I found the original source off
comp.sources.unix (I think...anyway, it was a version with all the
portability macros intact) and re-compiled with Laser C.

Wa-La! The version I compiled was much more robust and almost 1/2 the size!
(well, ~90K instead of 100+whatever) Haven't gotten around to
fixing any more bugs yet (like hitting 'n' w/out previous reg-exp)

If anyone wants the volume number of the archive, I could probably dig it up.

Hi all,

I used to have a 520 st system for about 4 years, then sold the
whole system in order to have money for college.

Now i am in college, and I need a computer.

I would like input as to what you all think I should do.

If the MAC and IBM emulators are good enough I will get a Mega 2 or 4,
but i have been out of it for a few years and dont know
how these programs are. Any and all information will be
appreciated.

The difference, as I have been lead to believe it, is that Mac owners
can buy Mac ROMs from Apple dealers. ST owners cannot buy disk based
TOS from ANYWHERE. Am I wrong? Where CAN I buy it?

Cheers,
Scott

Are there any database packages for the ST that allow you to access the database through C programs (like Btrieve, etc. for the PC's)? I would like to use an SQL database if possible. The only SQL db for the ST that I have heard of is RegentBase. Does it provide these C 'hooks' that I need? Or is this a lost cause for ST development?

From: krieg@jupiter.uucp
Message-ID: <1182@mrsvr.UUCP>
Source record: 248449

What does it mean when uudecode gives the message "short file"? Obviously it is an error of some sort, because the files extracted are cut off. I also sometimes get an error simply stated "Error 0". This occurs after a previous part has failed. Does uudecode add to a previous file sometimes? If I try to get the binary again, will it still fail, or is the error perhaps generated in the mail transfer? Any info is appreciated.

I've had my Atari since almost day one (before 1st word was invented) and
have used STwriter. It has been improved a lot, but is still part of the
public domain. It is not a wysiwyg, but has a lot of features such
as 2 column printing and mail merge. I still use it a lot.

From: adw3345@ultb.UUCP
Message-ID: <1407@ultb.UUCP>
Source record: 248505

Is there a program that will speed up disk access on my hard disk? I
was putting some files into a partition from a number of diskettets. It
seemed that it took an awfully long time to find free space as the disk
filled up.
When I did the same thing on a PS/2 at work, it was much faster, even
though my Atari outpaced it in disk reads.
Does TOS 1.4 help with this ? What can I do in the meantime?
What is the maximum # of partitions or megabytes the Atari can handle?

Thanks,

Derrick

> P.S. Why didn't Atari include a Move option in the copy routine?

You can move _files_; just select the files, hold down <Control>, and drag them to their destination. As long as <Control> is down when the mouse button comes up, you'll get a move instead of a copy.

>Aaron the Alchemist
>Charlop@uwachem.washington.edu
>
>P.S. Why didn't Atari include a Move option in the copy routine?

You haven't been following the "grapevine documentation" for TOS 1.4, Aaron..
(what..? you expected docs for your $100...? get real)

Atari *DID* include a MOVE operation in TOS 1.4...

It's Shift/Alt/Control/Help/Undo/Uppercase M/Lowercase M (at the same time)
while click dragging the file to its destination...

Far more intuitive than a drop-down menu option.. (what do you think this i..
a Graphics Environment Manager...?)

I'm sure someone here will tell you the actual procedure...

Pretty unnerving to think Atari is in such a bad financial situation that the
couldn't even afford to send out a mimeographed sheet with the ROMs to dealrs

(You *CAN* get TOS 1.4 documentation, but that requires joining the $300 club

Eric Hobbs asks:

> I am a two-and-one-half month new user of an Atari STfm. The VT52
>emulator that came with it puzzles me. This may sound like a trivial
>question to a ST experts out there, but what does this accessory do,
>and how do I use it???
>What is it capable of?
>
>I have no manual for it so any responses would be greatly appreciated.

I'm trying to remember, but I don't think my ST came with any documentation
for the VT-52 emulator ACC either...

Essentially, all it does is let the ST emulate a DEC (Digital Equipment Co)
terminal. The VT-52 terminal is a fairly standard unit, and the ST itself
uses VT-52 commands for a lot of its screen handling.

When you click on the VT-52 ACCessory, your ST becomes a VT-52 terminal. You
can send and receive text through a modem connected to the serial port of
the ST. If the computer you're connected to can send VT-52 "escape codes",
your screen will act just like a real VT-52 terminal.

If you have an autodial modem connected to the ST, you can send it's commands
by just typing them on the screen, for example ATZ to reset it, or
ATD5551212 to dial it.

Unfortunately, ALL the VT-52 emulator can do is send and receive text.
(As indeed a real VT-52 terminal does...) It CANNOT "upload or download"
programs to your ST from CompuServe or local BBSs, it can't "capture" text
and save it to your disk, and it can't maintain a "phone directory" of
numbers to call automatically.

The VERY best thing to do with the VT-52 emulator is to put it back into your
disk case, and say "Hmmm.. that was interesting", then go out and buy
a commercial terminal program like FLASH from Antic (they're running some
kinds of deals on it now), or Interlink from Intersect Software. (There
are also Public Domain programs like UniTerm an VanTerm available)

These programs are LIGHT YEARS beyond the VT-52 emulator, and give you far
more features (truly useful features...)

Actually it was kind of nice for Atari to have included the VT-52 emulator
with the ST, as it helped to demonstrate another facet of the ST's usefulness
But... to do anything really useful, you need to move on to something more
capable...

1490. Input thru printer port

Newsgroup: comp.sys.atari.st
Date: 1989-10-11 07:10:47 UTC
From: SCHWIETZ@DBNUOR1.BITNET
Message-ID: <8910110710.AA27097@ucbvax.Berkeley.EDU>
Source record: 248511

Several hardware expansions for the 1040 ST are designed to be accessed thru
the printer (parallel) port configured to act as an input port.
For example, the sound sampler which I purchased recently, directly feeds its
(TTL compatible, non-open-collector) outputs to the printer port.

Since the printer port is switched to OUTPUT mode during system initialization,
there is a good chance that the port lines are driven by two opposite voltage
levels, isn't it?
I'm not familiar with the electrical details, but isn't there the risk of
damaging the soundchip?

I've been using the sampler without any problems so far. Nevertheless,
I would like to know what's going on ...

I'd appreciate any comments and further information on this subject.

Would you say that a car should cost no more than $100? or $1000? or $10000? Or a computer for that matter? No more computing surfaces, no more Bentley Mulsannes (have to save a lot of pennies just for the insurance on that one!) yet they are no less _replicas_ than some piece of software.

You should be grateful that there is not more copy-protected and dongled software, and be grateful that somebody is prepared to earn their bread by supporting a 68000 machine of the future (immediate past, then) rather than an 8086 industrial relic!

On the original question, the plus version of first word is much better, but still mildly eccentric, WordUp now allows intermediate font sizes (using GEM fonts) but is still only one column, and systems such as Wordperfect are much more sophisticated.

Good luck in the hunt, anyhow!

Isn't PC_DDRVR.SYS a driver for 720K floppies for MSDOS versions 2.x???
I thought that PC_HDH.SYS was the driver to allow access to more than one
hard disk partition.
By the way, has anyone ever got this driver to work? I would like to use
my other hard disk partitions, but cannot figure out how to get set it up
in the CONFIG.SYS file. The file HARDDISK.DOC on the PC-DITTO disk is meant
to tell you about this, but on my disk I can't read this file because of
bad sectors (I've got a second hand copy.) Could someone please show me an
example of how to access partitions D,E & F from PC-DITTO I? Thanks.

IMG is, was, and always will be the standard GEM image format. NEO, P?3, etc. were invented by programmers too lazy to try to use the IMG standard. If we move to anything else, it will be something like TIF. Give up on NEO, it is only a toy format.

Yes, IMG is supposed to support colour too.

Message-ID: <8910120727.AA21640@ucbvax.Berkeley.EDU>
Source record: 248517

You cannot use gsub() in GAWK because it is a part of the new, AT&T sys V AWK, not the old, BSD AWK which GAWK is based on. There is source for a newer GAWK which supports _a few_ of the extra features found in The AWK Book, and I should have it fully running in a few weeks. Right now the code runs fine, but it has not been written properly, so I am having some problems with sub() and gsub().

1500. DESKJET clearance problems?

Newsgroup: comp.sys.atari.st
Date: 1989-10-11 14:31:46 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891011.08314529.068875@SFA.CP6>
Source record: 248521

Frans van Hoesel writes:

"WARNING: do not close the cover of the deskjet printer while printing
is in progress."

I've had a very faithful DeskJet since August of 1988 (that is
1988) and have had no problems at all with the plastics of the box.
However, I notice that there is not even a millimetre clearance
of the ink cartridge holder guard and the lip of the DeskJet top.
Could it be possible that Frans van Hoesel's top is slightly
warped?

1502. Ninetendo (ugh gag gasp) Gameboy

Newsgroup: comp.sys.atari.st
Date: 1989-10-11 14:39:37 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891011.08393605.068875@SFA.CP6>
Source record: 248523

Richard E. Covert writes:

" Also, I hear that the Ninetendo (ugh gag gasp) Gameboy is already out.
How is the Atari Lynz (or whatever it is called today!!) coming??"

I'm also disgusted at the situation. I live in a rural area where
no ST's exist at all and would be happy to see ANYTHING with the
Atari label on it in our area.
Well, guess what? Ninetendo is not only selling GameBoy at the
local Walmart for $78.00 (didn't price the AVAILABLE 12 games), but
the local video tape rental centres are RENTING the GameBoy.

Larry Rymal: |East Texas Atari 68NNNers| <Z4648252@SFAUSTIN.BITNET>

>= =
>= The Atari Addict A. Krieg =

Regent (the RegentBase folks) sell the SQL Add On for GFA Basic. You can access it from C - I've done it. It is a memory hog - about 400K. Also, it is nowhere near full SQL. It works, tho, and it's cheap. I bought my copy from E. Arthur Brown for $25. It is supposed to be compatible with RegentBase files, but I can't comment on that since I don't have RegentBase.

I'm not sure that posting works properly from this machine - let me know if this gets through.

I'll upload a sample C program later, if this posting makes it.

>>
>>Why stupid? Good software takes time to write, and a decent commercial
>>product can easily be worth more than $100.

I am sorry. This reply is just to mild. Could the first poster please
do a little arithmetic. I assume that you think that your time is worth
some money. (Lets give you some credit) What about $1 an hour. Ok so this
gives you 2 1/2 weeks to write a good word processor in. Ok, Ok, I can hear
the flames now.

1) These people market in bulk and should be able to sell for cheaper.
True, but with people with your attitude they are not able
to sell many.
2) Some of these programs were written for other machines using
common knowledge or public domain algorithms. (Yes I've heard this
one to justify the stealing of Word Perfect (TM))
True, but they have taken the time to polish these algorithms
and provide you the user with support.
3) I bought my Atari so that I could get cheap software.
Ok, remember cheap software more often than not = poor soft-
ware.

Paying $100 dollars for software is not just plain stupid.

There that should generate some heat.

1505. Formatting using a bad block list

Newsgroup: comp.sys.atari.st
Date: 1989-10-11 15:21:14 UTC
From: hcj@lzaz.ATT.COM
Message-ID: <818@lzaz.ATT.COM>
Source record: 248526

```
This is the README from my format.arc. Send mail, and I'll mail
it to you.
-----------------------

Here are two programs:
minihdx; used to format using a industry bad block list.
mkfs; used to partition, and build GEM file systems.

MINIHDX

Usage:

minihdx.ttp

minihdx SCSI LUN badfile "FORMAT"
where;
SCSI is the SCSI number (0-7).
LUN is the logical unit. If there is only one drive, it is 0.
badfile is a file of important parameters and the bad list.
FORMAT is a keyword that if omitted will prevent actual formatting.

The badfile is structured as follows. I have used parameters from my drive
as an example.

------ bad file follows -----
# THESE ARE MY COMMENTS, NOT in file.
# ----------------------------------
# my list any line starting with # is a comment
SERIALNO=188885 this is an ascii string
INTERLEAVE=1 my Adaptec 4000 recommends using 1.
CYLINDERS=511 number of cylinders.
HEADS=9 number of heads.
REDUCEDWRITE=511 if the drive requires 'reduced write' put the cylinder
# otherwise, set = to CYLINDERS
LANDING=4 where your drive should settle when parked.
STEPRATE=2 0, 1, or 2. 0=3ms,st506; 1=28us,st412; 2=12us
SECTORS=17 Adaptec 4000 is 17 is interleave is 1, 16 otherwise.
# MFM 16/17 RLL is 25 ?
# The format of a badlist CYL<tab>HEAD<tab>BIT_POSITION
# The BADLIST MUST increase monotonically!!!
BADLIST: the list of bad bits areas follows to the end of file
26 8 8521 cylindar 26, head 8, bit position 8521
485 8 9454
493 3 8633
496 7 8012
======================end of badfile==============
```

The Adaptec controllers have a cleaver scheme of handling bad spots on the disk. When the bad list is passed to the controller during formatting, it removes the sectors containing the areas so that the disk appears to be a linear sequence of good sectors; only a few appear missing at the end.

The bad list may contain at most 127 entries.

After formatting, I attempt to find out how many good sectors are on the disk. This is approximatly, TOTAL minus the number of bad spots. Somtimes a bad spot will cost 2 sectors, sometimes none. The SCSI command to read the size can only be issued on BMS-200 controllers. It fails on others. If this happens, then I use the approximate value.

Next, I write sector 0. This contains the following:
a. It is cleared to 0.
b. At the beginning is a simple program to stop disk booting should the checksum be set to 1234.
c. Hd_size, the size of the disk is set to the number of good sectors.
d. Other miscellaneous parameters are set.
e. Sector 1 is reserved for the Bad Sector List (BSL). This sector is cleared.
f. The number of Bad Sectors is set to 0.

Note: The BSL is an ATARI invention and does not need to know about the sectors lost in the bad list.

Sample:
minihdx 1 0 badfile FORMAT
to format SCSI 1, LUN 0, using badfile for parameters.
minihdx 1 0 badfile NO
will omit the formatting, but write sectors 0 and 1.

MKFS

Mkfs is used to partition and build TOS File systems. I had intended to use either the Supra or HDX301 'formatter' to partition the drive. My Supra software seems to want to format first, loosing my bad sector mapping. HDX301 is nuts. It requires using the BSL and other gunk. Additionally, after formatting, it does a bad sector scan, and screws up on my large drives.

I wrote this as a result. I have decided not to use the Atari HDX301 scheme for handling over 4 partitions. I use PC-Ditto and Spectre-128, and both of these expect the Supra Partitioning scheme. The Supra software is readily available and can be used to boot the hard disk and keep 12 partitions.

TOS1.4 will handle a full 32 Megabyte file system; but writes are S L O W! This large a file system needs a FAT cache. I did not support ATARI's really wild scheme of getting gigabytes by changing the sector size. Why couldn't they just change the Cluster Size, like IBM. Anyway, if the sector size is changed I can't use Norton utilities and PC-ditto on those partitions.

Mkfs has no parameters. It prompts for all parameters, and suggests reasonable defaults. After the SCSI and LUN are entered it reads sector 0 and prints the current partition table. If the drive has just been formatted this area

will be cleared to 0. Mkfs is usable on any drive. If that drive does not use Supra partitioning, partitions 4-11 may print a invalid numbers. Just ignore them and change only partions 0-3.
Partitions for Minix (MIX) and Spectre-128 can be allocated as well.

>
> Mike Matthews

Ok, now weill I didn't go to the WAACE Atari fest last weekend, I heard that the STacy on display at the show was the same old prototype that Atari has been showing for months!! It wasn't even a production model.

So, its VaporWare until I can buy it at my dealer!!!

P.S. so, where was the TT, 1040STe, CD ROMs, PC DITTO II?? Did Atari have the TOS 1.4 EPROMs for sell at the show?? Did Atari, the company, show anything NEW at the show??

Nope. I thought not.

I, for one, am just waiting for Jim Allen to develope his 68030 board for the Mega ST. I hear that he might even add more memory to it. And maybe better color graphics!! Heck, maybe Jim Allen (designer of that wonderful product Turbo16!!) can do what Atari has failed to do:
Design a 68030 computer and market it!!!

I heard that Jim Allen was at the WAACE show. Did anyone talk to Jim??

Paul, while most of us STers have access to usenet (how else can we read this message), we don't all have UNIX computers at home. But, your ideas sound good anyway. I have a thought, would it be possible to interface an ST to an IBM PC with a tape backup?? More folks out there might have access to such a creature.

There are a lot of Bourneoulli (sp?) boxes out for IBM PCs, and other forms of tape backup. But, except for the ICD FAST TAPE, which is $900 plus tapes, and the SysQuest 44 meg removable drive, which is $800 plus $110 per cart, there is very little way of backing up a large hard drive. So, your ideas are most welcome.

TOS 1.6 is no rumor. It does exist. However, it is the TOS that is going
into the STE machines. No upgrade will be offered from TOS 1.4 to 1.6. The
only differences in TOS 1.4 and TOS 1.6 are the support of the enhanced
graphics and sound that are available in the STE machine.

1520. PC Ditto II

Newsgroup: comp.sys.atari.st
Date: 1989-10-11 21:45:44 UTC
From: FRAJKOR@CARLETON.CA
Message-ID: <891011.16493478.055909@CU.CP6>
Source record: 248541

Can someone (preferably someone from Avant Garde if they
monitor this line) answer thequestion as to whether installing
PC DittoII in an At ari 1040 ST precludes upgrading the
1040s memory to more than it originally had? The plamphlet
advertising PC Ditto II says it works with "unmodified" STs.
I take this tomean that if I have a 1040 with one meg now, I cannot
upgrade it to 4 meg and still intall PC Ditto. Am I correct? Does t
it mean that to get a 640K IBM clone I have to give up a 4meg ST?

They say I am a skeptic, but I do not believe them-- old Slovak proverb

I shouldn't do this (don't want to start a flame war here...), but no, the
screen *is* something totally new, and has been heralded as the *best* display
on a portable around. We Apple-junkies really don't like paying an arm and a
leg, and love to point out the cheaper competition, but even the MS-DOS super-
popular portables can't compare screen-wise.

And it's IBM that creates the new names for old stuff (e.g. "pel" and "fixed card"
for "pixel" and "hard disk"...), not Apple. The NuBUS is more standard than NeXTs
on the Macs. There's a different card in the Portable because it uses a different
CPU than an SE/30 (their slots are the same size) and because of the power
constraints. Different machines, with different power capabilities. It was a
better move.

Is it too expensive? You betcha. The biggest gripe is the memory: the *most*
expensive memory chips are required (Static DRAMS), and of course, come a year,
you're gonna NEED that expensive RAM to run the new system software.

Hm... WordUp is available for about $50. This is a pretty darn good
word processor. I suppose "more often than not" is the key phrase here.
While there certainly may be a lot of freeware/shareware/cheapware that's
garbage, there's also a lot that's real good. (There has to be, or else
people would stop using it, right?)
>
>Paying $100 dollars for software is not just plain stupid.

Depends on the software package, I guess. I'd saying *paying* *any*
money for a terminal emulator is stupid, with Uniterm around. Of
course, a shareware donation wouldn't be out of the question... }-)
On the other hand, paying $100 for a decent CAD program would probably
be a bargain... It all depends...

That turns out not to be the case.

The VT-52 accessory does not emulate a VT-52. On the trivial side,
escape sequences are supported that change colors. The VT-52 never
had any color other than black and white; trust me, at one time, I
fixed them. On the serious side, NONE of the escape sequences that
should be generated by the keypad (in application mode) and the
4 function keys can be transmitted without typing them in directly.
This means virtually none of the VAX applications will work with
it (including EDT, FMS and TDMS).

Yes, Rainbow TOS (a.k.a. TOS 1.4) helps with this. A LOT. There are
speedup programs available in the meantime, but I have not used them, and
have no idea how stable/fast/trustworthy they are. I'd recommend you
get Rainbow TOS, for this and lots of other reasons.

With all the usual talk of "Atari's blown it again, etc., ad nausem"
from many on this net, including myself, it might be refreshing to know
that product is arriving, at least in this little neck of the woods, this
IBM and Mac world that I live in.
At our university, I saw two Portfolios that just arrived. One was
at the bookstore labeled to go to the legal school and the other is going
to the sports department.
To top it off, if you call 1-800-443-8020, you will not only get a
nice lady answering with "Portfolio Hotline" but she will quickly tell
you where your quickest dealer is. To be frank, I was so flabbergasted
at the professionalism that I forgot to ask if I could have ordered a
Portfolio via the same number.
I did retain enough mental capabilities to ask if I could have some
material for the Portfolio. "Why yes. What is your address?" I actually
remembered my address.
Anyway, I think the door is beginning to open.

What if they had already had the ROMs in production, and it was too
late to change them? Did you ever ASK if this were so, or did you just
charge out and say Atari was a bunch of idiots? No wonder they don't
answer your postings.

>> Or, a user sees TOS14PATCH.ARC on his BBS, and wonders if he's

>> home machine. Atari isn't Sun.
>
>Greg, the user already needs an auto folder patch for the TOS 1.4 that is being
>sold by Atari. How many more patches will be needed over the next six months??

Well, ALL tos 1.4 users use the same patch. I assume that Atari, being
fairly smart people, will arrange it so that if future patches are
needed, it will still be one file. This is much simpler ("Get this one
latest patch file") then worrying if you have TOS 1.4a or 1.4b or 1.4c
and having to get the right patch for each version.

All in all, it's much easier to support one rom for which you're
supposed to have one patch file, than 14 different versions and 14
different patch files.

1533. Draft Graphics printing in WORDUP

Newsgroup: comp.sys.atari.st
Date: 1989-10-12 11:54:42 UTC
From: jackin@utacs.UTA.FI
Message-ID: <756@utacs.UTA.FI>
Source record: 248303

I use WordUp for wordprocessing and I like it a lot. I have a wonderfull matrix printer which can print at 360*360 dpi(NEC-emulation), emulate IBM ProPrinter, NEC P-series and Epson LQ-series. It is Citizen Swift 24. I must say that I am still impressed by the crispness of the output but it ain't no speed demon with 360*360 dpi. Waiting almost 20 minutes for a single page isn't very practical for drafts (not for ribbon either). As all WordUp users know draft graphic printing isn't reality (except for Deskjet). Well, I thougth, I have Epson LQ emulation so why not make different assign.sys files for NEC-emulation and Epson LQ-emulation.

I just installed WordUp twice with different printers and now I have two different GDOS.SYS-files (one is GDOS.NEC the other one GDOS.LQ, you have to rename them yourself). With G+Plus accesory I made also two Assign.ins-files (WUP_NEC.INS and WUP_LQ.INS). Now when ever I start wordprocessing I use Epson LQ for drafts (if you want to call 180*180 dpi draft <-) and when I am happy with my work, I quit WordUp, change INS-file to WUP_NEC.INS with G+Plus and start WordUp again. Then I tell Swift to emulate NEC and start printing. Result : 360*360 dpi document.

I also tried using Epson FX-emulation (under Epson LQ-emulation), but it doesn't work properly (the hight of the text and graphics increases by factor 1.2 (about)). But under IBM-emulation it works. Now I have also a 120*144 dpi draft. Like ST, Swift can emulate almost everything.

So if you have a printer which can emulate a less-dpi printer (and have a GDOS-driver) give it a try. Think of it, I saved 112680 Dots Per Square Inch (from 129600 down to 16920). This should work for other GDOS-programs too.

While I am here, is there a update for G+Plus after V1.3, Rel. March 19th, (I am a registered user, I have tried CodeHead but got no response) ?

It will help a lot using a disk-cache program and reserve 1 MB for it (if you have 1 MB free RAM that is). Then the last 1 MB you read from the HD will be kept here, useful when you first edit something, then save and compile - The compiler doesn't have to read the file from disk - its in the cache-buffer and everything goes much faster.....

While i was testing my formatter i built a 32 meg partition on one
disk. To test it I filled up by copying my 16 meg C: partition to it
twice. The setup is source C: on drive 1 (SCSI 0) and destination G:
on drive 2 (SCSI 1). After 16-20 meg of copying, it gets noticeably SLOW!
I suspect this is a consequence of clusters being allocated 1 at a time
and the FAT bewritten after each allocation.

Oh well, its nice to know that TOS1.4 will support 32 MEG. Its just not
time effective to make partitions that large when one can easily put
12 partitions on a disk.

The PC-Speed board I mentioned contains a v30 chip and I saw a socket which I believe is for a co-processor. I am not sure of the clock speed. It runs CGA graphics and emulates the Hercules in mono mode. I was told that the screen display on a mono Atari monitor is extremely impressive. Far better than the standard Atari screen which is already crisp. As I get more details I will post them on the net.

1538. PMFS Serial Disk Driver (New version)

Newsgroup: comp.sys.atari.st
Date: 1989-10-12 14:12:48 UTC
From: paulm@ccicpg.UUCP
Message-ID: <43134@ccicpg.UUCP>
Source record: 248308

Friday I'll posting a new verion of PMFS to accomodate slower baud rates
and configurable built-in cache in the driver. The driver cache can be
anywhere from 0 slots (blocks) to as many as you have memory for. The
cache only caches Single Block I/O because 90% of these are you directory
and FAT read/writes. Just cacheing those is a great speed-up.
The cache is configured during the first installation of the driver.
Either type pmfs {blocks} from a CLI or rename pmfs.prg to pmfs.ttp and
pass the number of blocks in the dialog box.
I'll still looking for a way to emulate ? the GEM [ESC] key function.
Is this clearing TOS's cached directory blocks or something ? Where
do I find them to clear them myself ?

TOS 1.4 speeds up disk access considerably when a disk fills up. Until then, you can use FATSPEED.PRG (not sure where it's available up in Rochester, but it's been available on Gallifrey for a while [ahem]), which is an AUTO patch that works fine. I used it before I had TOS 1.4 without any problems.

Peter,
TOS 1.6 is the version of TOS for the mythical 1040STe.
That much has already been said by Atari.

Interesting enough, TOS 1.6 is also supposed to be the version
going into the TT/P.

> EVERY program is now running fine. I am having the dead machine problem
> which I'm working on now - the system acts as if it was too cold...
>
> Peter Szymonik

My system consists of a Mega ST2 upped to 4 megs RAM, both monitors, a Monitor Master switch box, the SLM804 laser printer and a dual 65 meg drive from ABCO Computers in FL. And lastly, the Turbo16 from FAST TECHNOLOGY, along with the TOS 1.4.

And everything works fine. I haven't run into any problems either attributable to the T16 or to TOS 1.4. And I have 3 local friends who has TOS 1.4 with T16, and none of them are having any problems. I haven't formatted my drive since I bought it a year ago.

Heck, even Calamus works with the T16!!!

Sorry that I can't help you Peter. I just wanted to let you know that others don't appear to be having that problem. Did you check your installation??
Oh one thing. It is a known fact that the 74LS373 need to be replaced with 74AS373, as the AS version has twice the current drive of the older LS chips. Maybe you should try that?? My dealer does that replacement as part of his standard installation of TOS 1.4 and the T16.
Give it a shot. Let the net know of your results.

Richard Covert (I love the T16!!)

1545. laser printer vs. hard drive

Newsgroup: comp.sys.atari.st
Date: 1989-10-12 16:02:23 UTC
From: dennis@phyllis.math.binghamton.edu
Message-ID: <DENNIS.89Oct12120223@phyllis.math.binghamton.edu>
Source record: 248315

I have a mega-4, atari laser printer, and external hard drive (Supra card). Apparently when I boot with the laser printer attached it must be turned on; otherwise I can't access the hard drive. If I turn the printer off after I boot I have trouble accessing both the hard drive and the floppy. It's a real pain to swap cables to bypass the laser printer. I talked to a dealer who said that this was "normal behavior".

So:

1. Is there any danger to the laser printer if I leave it on while I'm using the mega? The system is usually on about 8 hours a day, seven days a week.

2. Is there any switch available which will allow me to use the machine with the laser printer still attached but turned off?

3. Is there anything else I can try?

1546. Re: PD wordprocs and VT52 emulator

Newsgroup: comp.sys.atari.st
Date: 1989-10-12 16:37:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8910130702.AA13381@ucbvax.Berkeley.EDU>
Source record: 248316

1. PD wordprocs

The attitude that it is nuts to pay more than $100 for software is the reason why there is not the same level of quality in much of the STware as there is in Macware. As I said on the NET before, if you want good codes, with good support, you have to pay for it UNLESS you find individuals like Simon Poole (UNITERM author) who develop exceptional PD codes. Strange as it may be, lots of people want to make money selling software; if they cannot, be prepared for a machine that has a limited selection of good codes.

2. VT emulator

Forget the EMULATOR.ACC and get Simon Poole's UNITERM. UNITERM is the best ST emulator for the price (free). IMHO, it's the best at any price (no flames please).

>been showing for months!! It wasn't even a production model.

I personally have never heard of a Stacy4 with 4 megs of RAM and an internal
hard drive, until I saw it at the Fest.
There is some problem with the local editor and what terminal type it thinks
I'm using, so some of the lines from your old message seem to have disap-
peared. Your definition of Vaporware is... well, not what I would consider
OK. The STacy isn't vaporware. It is unavailable. Vaporware means, to me,
the product doesn't exist in any form.

>P.S. so, where was the TT, 1040STe, CD ROMs, PC DITTO II?? Did Atari
>have the TOS 1.4 EPROMs for sell at the show?? Did Atari, the company,
>show anything NEW at the show??
The TT etc. were absent (I'm a little upset at that too). Atari wasn't there
to sell anything (they seldom, if ever, SELL anything at a show, just demo
stuff). The new stuff they showed, aside from the STacy4, was the Portfolio
and a Megafile 60 (not very exciting, but it IS new).
>
>Nope. I thought not.
Since you yourself said you werne't there, I wish you'd stop making statements
that would require your presence to verify them.

>I, for one, am just waiting for Jim Allen to develope his 68030 board for the
>Mega ST. I hear that he might even add more memory to it. And maybe better
>color graphics!! Heck, maybe Jim Allen (designer of that wonderful product
>Turbo16!!) can do what Atari has failed to do:
> Design a 68030 computer and market it!!!
>
I'd rather have a computer designed for an '030. The Mega is too closed an
architecture to allow any good to come from putting an 030 in there (compared
to a real 030 machine).
>I heard that Jim Allen was at the WAACE show. Did anyone talk to Jim??
>Richard Covert

If I didn't now better, I'd say someone else wastrying to type into this
document. <sigh>

One question I wish you'd ask yourself is this:
what good is all this complaining doing?

Mike Matthews

Well, who got out of bed on the wrong side this morning? :-)

When I bought TOS 1.4 from my dealer I got a nice, four page document from Atari describing the new TOS procedures. Included was the new file selector ("formerly called item selector"), the MOVE operation (hold the ctl key when you drag files), warm/cold resets from the keyboard (Ctl/Alt/del Ctl/Alt/Rshift/del, resp.), installing auto-booting gem applications, and a few other things I can't remember right now.

Maybe you should be flaming your dealer instead?

1550. Request for comments about Atari ST RAM upgrades

Newsgroup: comp.sys.atari.st
Date: 1989-10-12 17:42:14 UTC
From: wyant@eplrx7.UUCP
Message-ID: <868@eplrx7.UUCP>
Source record: 248321

We have recently acquired a hard disk and several software utilities for our 1 MB Atari 1040ST (at the recent WAACO). This has us wondering about the the possibilities for a RAM upgrade, perhaps to 2.5 MBytes. The prices which we have seen for such an upgrade vary by quite a bit, being between $305 and over $400 (US). So, now a list:

A) Is such a RAM upgrade desirable? Our Atari serves both for games and desktop publishing. The utilities/accessories might be expected to occupy up to 0.25 MBytes.

B) What is the difference between the solderless and conventional upgrades? Is a solderless upgrade merely a DRAM swap?

C) What about the extra heat generated by all those RAM's in such a small (ST) box? Is it substantially greater than for the standard 1 MB?

D) Do you have any recommended places for us to consider having such an upgrade performed? Do they perform an infant mortality test?

Since this is probably a frequently recurring question, a mail reply might be best. Thank you for your comments to these questions and the general issue of memory upgrade for the ST.

I'll post the code, it's not long. It's got a few hacks in it they others
may find interesting. Note that I use Mark Williams C. The code is
probably not directly portable as it depends on the order in which parameters
are passed. You'll need to check on such things before using any other
compiler, but you should have no trouble.

>This programmers add-on does not require RegentBase? Do you mean it offers

>Andrew Krieg

RegentBase is NOT required. Tool basically gives you one function by
which you pass SQL statements and get back results. You can create
tables and do queries, including the various types of joins. SELECTs
which return multiple rows do not behave in the usual manner.

Like you said, don't expect much. But for $25, it's a good hack.

1554. adding a 68881

Newsgroup: comp.sys.atari.st
Date: 1989-10-12 18:35:02 UTC
From: idh@NABLA.ELECTRICAL-ENGINEERING.UMIST.AC.UK
Message-ID: <8910121935.a014091@nabla.electrical-engineering.umist.ac.uk>
Source record: 248326

Thanks for the replies to my posting asking for 68881 add-on info. The machine I intend adding the coprocessor to is a recent 1040STFM. It has two ROM chips, surface mounted GLUE and MMU chips and the 68000 is positioned below the keyboard space bar. It has been upgraded to 2M ram. I understood a German company (Lischa Datentechnik, Hochstrasse 22, 4173 Kerken 2) produced a board that was stuck ontop of the 68000, it sounded suitable, I wrote to them but no reply came. If any one knows about Lischa & the 68881 please elaborate. I tried to get a Third Coast CMI accelerator board, ordered it in june, they cashed the cheque, they still havent sent the board, despite having advertised its existance for months. I phoned them, they said 'ready in two weeks' .....four weeks ago. I am not happy with Third Coast's service.
In reply to Wolfgang Hecht's enquiry about ST Fortrans, the only Fortran I am familiar with is by Prospero. It is well documented, has a good debuger, and produces code that runs 20KWhetstone/s double precision 50KWhetstones single precision (and 200KWhetstones for both precisions with the 68881). Both single and double precision use the IEEE floating point format. About the only gripe I have against it is the rather slow compile and link times and the slow editor screen manipulation (much improved with turbo ST 1.6).

1560. TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1989-10-12 22:44:27 UTC
From: jsd@gaffa.mit.edu
Message-ID: <1989Oct12.224427.5397@eddie.mit.edu>
Source record: 248332

OK, I know everyone is going to be sick to their stomachs at seeing
this question, so do us all a favor and reply by MAIL only.

What new features does TOS 1.4 offer? I have the Mega ROMs in my
souped-up 520ST (double sided drive and 1 meg memory expansion).
How much does it cost and where would it be preferable to get it
from? I got the Mega ROM upgrade from a dealer on six chips, which
I popped in myself in 10 minutes.

Basically, is it worthwhile doing this upgrade?

```

No, and no, and no. It was Gadgets by Small's Stacy, not Atari's.
Whether or not it is a production model or not I can't tell you.

>P.S. so, where was the TT, 1040STe, CD ROMs, PC DITTO II?? Did Atari
>have the TOS 1.4 EPROMs for sell at the show?? Did Atari, the company,
>show anything NEW at the show??
>
Dealers had the TOS 1.4 EPROMs for sale at the show. Atari has
already stated that all TOS 1.4 ROMs will be sold through dealers, so
it's no use asking if Atari had TOS 1.4 EPROMs for sale.

PC Ditto II was not shown because of scheduling problems.
PC Ditto II is not SHIPPING because it's not ready yet -- it's waiting
on a cable assembly which will make it simpler to install.

The TT, 1040STe, and the CD-ROM were not shown. If they had,
no doubt you would still be complaining about vaporware. Just as well
they didn't, eh, so you could be justified . . .

I wasn't there long enough to address any of your other
questions, so I won't include them. Sorry.

800k DS drive internal capable of reading MS-DOS and TOS disks
mouse
1 megabyte of memory (1024k)
TOS v1.4 eproms installed (latest version)
-Atari Sm-124 Monochrome Monitor
high resolution, fine dot pitch monitor
-20 disks of PD utilities, games, applications to start up with
some original, most PD.

computer is capable of fine MAC emulation with commerical package called
Spectre GCR and will emulate PC a AT speed with Norton SI rating of 3.0
with package called PC-ditto II. Excellent machine, these two packages
are not included.
(YOU guys should know this)

Sell for 800 dollars or trade for PC clone.

please contact the seller at his beeper
at 305-353-5303 for fast response. or e-mail me and I will relay the message.

Re: Laser C 2.0 and TOS 1.4

Scott, as far as I know, there is no way to make Laser C 2.0 run on TOS 1.4. I called Megamax about this way back when and what the guy told me is that there never was a PATCH.PRG. They decided to fix up Laser C instead, which eventually became Laser C 2.1. He also told me there was some way to patch up the LASER.CFG file file but I tried many times and couldn't figure out his instructions. (The byte pattern he told me to look for simply was not in the .CFG file). About 6 weeks later they finally shipped version 2.1. They fixed a bunch of bugs but sadly enough, Laser C 2.1 still has serious code generation bugs that date back to the days of Megamax C. I have reported these bugs to them several times and each time they tell me they fixed them. They also refuse to put in an option to turn off that stupid stupid STUPID disk cache in the shell. In more cases than not, the desk cache actually SLOWS DOWN hard disk access, by a factor of 10 in some cases. I'd prefer if they got out of the disk cache business and stuck to fixing up the compiler. I don't appreciate having a compiler generate incorrect code on me, which is what Laser C will do the odd time. I just stick to assembler for now while somebody writes a decent C compiler for the ST.

This is a repeated question. I'm in the market for a database, and having no experience with them, would appreciate the views of the net on them. The more specific and detailed, the better, of course.

I originally posted this about five days ago, and got exactly five responses, three of which were 'could you let me know, too'. At this point, replies via either e-mail or public means are more than welcome. Those of you who maintained silence for fear of deluging the recipient are hereby invited to attempt it. I'll summarize the e-mail responses I get.

1568. High-speed modems and the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1989-10-13 05:15:33 UTC
From: logic@wet.UUCP
Message-ID: <665@wet.UUCP>
Source record: 248340

Having just recently acquired an USR Courier HST Dual Standard, I am anxious to compare notes with other ST users who favor the USR high speed modems, especially in the area of throughput.

I am currently getting about ~1625 cps in HST mode. Protocal used is Zmodem and I have the comm port locked to 19200 with TURBOCTS installed. The USR manual says that I should be getting 1740 cps while in HST mode. So where is the missing ~100 cps?

Also, is there terminal software out there which supports Ymodem-G? I noticed that on uploads, my throughput drops way down to ~600 cps. So I want to see if using Ymodem-G instead of Zmodem will kick that cps rating up a little bit.

Please mail any replies. Thanks.

Message-ID: <8910130706.AA13714@ucbvax.Berkeley.EDU>
Source record: 248343

I'm kinda new at this stuff, but I've been having some trouble
getting arc'd files from ftp sites... specifically terminator.
I think it has something to do with the setings of my VAX ftp
end since I've been able to successfully send binary files from
my ST to the Vax and back, but I've not been able to get one
FTP'd program down to unarc correctly.

Also, is there a program around, (vax arc) so that I can check
the integrity of the files before I waste time kermiting them to
my ST?

Any help would be appreciated.

1572. Harddisk/ST problem!

Newsgroup: comp.sys.atari.st
Date: 1989-10-13 08:45:28 UTC
From: joep@tnosoes.UUCP
Message-ID: <495@tnosoes.UUCP>
Source record: 248344

First I thought it was because of a program I wrote using lots of
'malloc'/'free'-s. But then I found a very simple sequence of
actions leading to the same 'nice' dialogbox:

"NOT ENOUGH MEMORY TO LOAD THIS APPLICATION"
(or something like that)

Example:

I have, for example, the following directory-structure on F:

DIR1
FILE1.1
FILE1.2 ...
DIR2
FILE2.1
FILE2.2 ...
DIR3
FILE3.1
FILE3.2 ...

* I double-click on DIR1 and I see FILE1.1 and FILE1.2
* I go UP and double-click on DIR2 and I see FILE2.1 and FILE2.2
* I go up again
* NOW: do a SHOWINFO on drive F: getting some info.
* I double-click on DIR1 and I see FILE1.1 and FILE1.2
* I go UP and double-click on DIR2 and I see FILE2.1 and FILE2.2
? Going up and double-click on DIR3 and I SEE: "0 BYTES 0 FILES" !!!!!!!
? AND: trying to start an application.... right... OUT OF MEM...
* RESET, dclick of DIR3 and there are my files again.

It looks like that any directory I dont open is empty after a showinfo!
No matter how hard I click on a dir the computer won't even read
something from disk. Thinking that some utility was the cause of the
problems, I removed them all (thus FILEFIX.ACC TURBO_ST etc etc), but
it stays the same.
So or if have some VIRUS or my harddisk is a little disturbed. I think
it is the last option. Somebody told me that using TURBODOS can cause
trouble with your harddisk! IT THAT SO!

Somebody tell me what went wrong.

From: colas@mirsa.inria.fr
Message-ID: <250@mirsa.inria.fr>
Source record: 248345

I grabbed recently the uemacs3.10 sources on purdue, but didn't manage to
compile it successfully with MWC 3.0.6: It works, but:
1) It does not use inverse video for mode lines
2) it aborts with 4 bombs when trying to do TOS functions
(for instance with ^X-!) under msh (v2 or v3)

Could someone who have a working binary could just put it by ftp on
terminator.cc.umich.edu, where anybody could grab it? (or mail it to me,
I would then put it myself on terminator...) -- or tell me what flag to set
to re-compile it properly?

Uemacs 3.10 seems a very reasonable alternative to Gnu emacs, especially on
a floppy-based 1Meg ST!!!

Thanks,
colas.

$305 or so for 1) a board and 2) 16 1-meg drams sounds good.
>
> A) Is such a RAM upgrade desirable? Our Atari serves both for games
> and desktop publishing. The utilities/accessories might be expected to
> occupy up to 0.25 MBytes.

I would think extra mem would be particularly useful for DTP.
I run MINIX-ST it it loves extra RAM.
>
> B) What is the difference between the solderless and conventional
> upgrades? Is a solderless upgrade merely a DRAM swap?
>

solderless uses 1) a pass-thru socket to pick up most signals
from the video shifter. 2) a press on thing to pick up signals
from the MMU.

solder: you get to locate and tack down lots of wires.

DRAM is not swapped. .5 meg stays used, .5 meg is lost. the board
adds 2 meg in 16 1 meg DRAMS.

> C) What about the extra heat generated by all those RAM's in such a
> small (ST) box? Is it substantially greater than for the standard 1 MB?
>

DRAMS are cool running -- I've seen no difference.

> D) Do you have any recommended places for us to consider having such
> an upgrade performed? Do they perform an infant mortality test?
>
Most places supply a board and a phone number. You supply the
DRAMS and install it. Its pretty easy for solderless.

Unfortunately, panarthea isn't accessible from the Internet by anything but mail. As my original message stated, send the word "help" to the mail address archive-server@panarthea.ebay.sun.com (if your mailer doesn't handle MX records properly, you can use archive-server%panarthea.ebay@sun.com) for information about accessing the archives. The server tends to respond very quickly.

Actually, I guess this is indication that it's time for my "how to retrieve/unpack binaries" article once again. (I thought I'd put a long expire time on it. Are people not reading it? How can I change the document so that the above question doesn't get asked once a week?)

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: October 13, 1989

A preliminary note, for those of you who know most of the
below already: the official archives on panarthea are NOT
reachable via anonymous ftp from the Internet. Read on for
information about accessing them by mail, or see the table
at the end of this document for a list of alternate archive
sites.

_1. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than
normal text. Usually, a binary that is posted to the net
w*ZNR3

tinct from _s_o_u_r_c_e_s, which are the human-readable text files
that are interpreted by a computer and used to produce
binaries. Sources can be modified with relatively little
effort, and are usually pretty easy to read. Binaries are
not intended to be viewed by a human.

_1._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and
electronic mail) are not always capable of handling a pure
binary file. They are designed to handle textual messages,
and the odd symbols and characters in a binary cause them to
become confused, and often to mangle the binaries. To avoid
this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencod-
ing translates a binary file into text characters, so that
the news and mail transport programs won't mess up. The
disadvantages are that uuencoded files are about 30% bigger
than the raw binary files they represent, and that you have
to go through one extra step to get the binaries to work on
your computer.

_1._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work
properly. The extra files might be data files, help files,
or maybe some instructions for the user. In order to easily

package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown

together.

To confuse matters even more, a new archive program called "zoo" can also be used to achieve the same effect. Zoo is superior to arc in some respects, slightly inferior in others. Unfortunately, you can't unpack a zoo archive with arc, or vice versa.

_1._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 45000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator will usually post introductory articles, including a list of previously published articles.

_2. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week (usually much less) of the time they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site panarthea.ebay.sun.com has all the binaries stored in its archives.

Using Binaries -3-

The other way to get binaries is to request them from panarthea's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you. One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

To find out more about the archive server, send a mail message containing the word "help" to archive-server@panarthea.ebay.sun.com. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@panarthea.ebay.sun.com to report the problem.

There are other archive sites, too, such as terminator.cc.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. Some sites, such as terminator, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp terminator.cc.umich.edu", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information. A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect. Note that panarthea does not offer anonymous ftp, as it's on a network that's segregated from the Internet.

Panarthea also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of the archive-server's index files for the binaries and sources groups whenever new files are added. Note that if your site

gets comp.binaries.atari.st, requesting autoindex is pointless and a waste of net bandwidth. Send mail to autoindex-request@panarthea.ebay.sun.com if you'd like to sign up.

_3. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple

_____
|- UNIX is a trademark of Bell Laboratories.

of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc on your Atari.

A version of uudecode written in ST BASIC is available in panarthea's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's _s_o_u_r_c_e_s and not binaries). Once you have that, you should get the files "arc," "arcdoc," and "uucode" from volume 1 of the binaries directory. They contain the arc program mentioned earlier, its documentation, and a much better, faster version of the uudecode program.

Use the BASIC program to uudecode the two encoded files; then use arc to unpack the better version of uudecode. (Arc is documented in "arcdoc.") Note that if you're reading news/receiving mail on a computer (such as a UNIX system) that already has uudecode, you can skip most of this; you will probably just want to uudecode arc there, then download it (using kermit, xmodem, or your favorite transfer protocol - consult your site's administrator and your Atari communication package's documentation for more information. Remember to use binary mode when downloading arc files!)

So far, everything has been small enough to fit in one piece, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source code, also suitable for compilation on UNIX systems, is available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so don't give any of the parts the same name as the file that's being extracted from them!

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know

about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass (with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files.

Most archives contain documentation; refer to the instructions in a specific program for usage information and the like. If you have problems with a particular program, send mail to the submitter (listed near the top of each part.) The moderator doesn't have time to become very familiar with all the programs that are posted, so the submitter will probably be much more helpful.

_4. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be
wrong. Mail servers usually respond to the word "help"
alone in a mail message. Some of the sites listed below may
not contain full archives of comp.binaries.atari.st, and
some may have other files.

I have two Portfolios, I had an Atari PC-4 two weeks ago, I'm told that a STACY and two 1040STEs will be shipped to me within two weeks. My secretary asked "Did you see the nice Atari ad on T.V. last night?"

As far as I'm concerned, all things are looking great for Atari. Cannot wait to have a TT in my hands.

My Ditto II is late and my additional GCRs have not arrived (in addition to my gamma test copy) but hey, any day now.

I expect to demo a STACY + GCR to our users' group on November 8th. I know that STACY + GCR does not compare with the Mac laptop that was shown on site last week, but at 40% of the price, the STACYMac will be a killer product!

Source record: 248203

I upgraded my 520ST to 2.5 meg using an AERCO (Austin, Texas) upgrade board.

I first upgraded from 512K to 1Meg, doing the upgrade myself w/ no problem at all. After the second upgrade to 2.5Mg, I did have some problems with the system which I attributed to overheating. I leave the cover somewhat looser than before and everything's ok so far. Bear in mind this is a 520ST--not much room for expansion!

About a week and a half ago, I asked about the availability of TeX and related utilities, as well as of a newer version of gulam. The only answer I got was that the last gulam version posted to the binaries newsgroup is about two years old. I got no answers regarding TeX.

Could some kind soul who has the stuff (there are some of you out there) send it to Steven so he'll post it? Or is it too huge for the net? (excuse my ignorance). The same goes for a newer version of gulam, in case such a thing exists. How about you, Steven? Can you ftp some of this stuff and post it?

> different patch files.
>
> Greg Lindahl

The problem Greg is that you just plain and simply can't count on
Atari for support!! If Atari was going to support the ST, why didn't Atari
license GPLUS from Charles Johnson and include it in TOS 1.4??

Why didn't Atari make any improvments in GDOS for TOS 1.4?? I have over
3 megs of GDOS fonts for my SLM804 and if it wasn't for Charles Johnson's
GPLUS I wouldn't use any of them!! The GDOS support in TOS, even TOS 1.4,
is almost zero compared to what GPLUS offers. And GPLUS has been out for
a year now, so Atari could have licensed it from Charles Johnson.

And Atari didn't even want to admit that there was a bug in the serial
port code in TOS 1.4 until the Canadian hacker showed Atari the actual
bug in the code. Pretty responsive of Atari, huh?? And this is for an OS
that has been under development for 2 years!! After 2 years, you would think that
Atari would have it right!!!

Boy, a good outline font system, aka the macintosh system, would really be
great for the ST!! But asking Atari for anything like that is like jumping
to the moon, you'll never get there!!

I like the third party support starting to appear for the ST. My favorite
product is the Turbo16 product from FAST TECHNOLOGY. T16 really speeds up
my Mega ST!! It is great!!!
So, lets support the good 3rd party enhancments to the ST and hope that
things will get better IN SPITE OF ATARI!!

Rich (Proud owner of a souped up T16ed Mega ST4!!) Covert

I bought TOS 1.4 from my dealer when I bought the FAST TECH Turbo16
board for my Mega ST4, and the floppy disk copy time is really improved.
I can't tell how much is caused by the T16 and how much by TOS 1.4,
but I couldn't believe how much faster a 800K floppy copyied to my
hard disk.

And the Move command works in TOS 1.4 just like John Townsend said in an
earlier message. My local ST dealer has been selling TOS 1.4 for a week or
so, and everyone likes it!!

Good for you Atari!!

> 3. Is there anything else I can try?

Dennis, I too own the SLM804 and an external hard drive. My local Atari
delaer came up with a solution to the problem. It tunrs out that if the
SLMC804 controller box is powered up you can turn off the SLM804 laser
printer itself. But, as the controller box is powered by 5 volts DC from the
laser printer you can't turn on the controller box with the printer turned off.
So, my dealer made a little cable to steal 5VDC from the second joystick port
on my Mega ST. And voila, I have power to the controller box even when the
SLM804 is turned off!! I have repeated this solution many times on this
newsgroup, but nobody seems to remember it. Contact Henry Ahle at Computer
Works (602-246-6364) in Phoenix AZ and he can help you.

I have never heard from anyone at Atari about this patch cord. But, it has worked
for me for over 18 months now.

Good luck!!

Rich Covert

1590. Presentation Manager

Newsgroup: comp.sys.atari.st
Date: 1989-10-13 17:21:52 UTC
From: pa1329@sdcc13.ucsd.EDU
Message-ID: <1328@sdcc13.ucsd.EDU>
Source record: 248211

the following is from comp.sys.amiga. I think it is of some value
to us too, for improving the GEM stuff.

The article follows.

Article 43667 of comp.sys.amiga:
>From: UH2@PSUVM.BITNET (Lee Sailer)
Newsgroups: comp.sys.amiga
Subject: presentation manager
Message-ID: <89286.092706UH2@PSUVM.BITNET>
Date: 13 Oct 89 13:27:06 GMT
Organization: Penn State University
Lines: 37

I saw a demo of OS/2 and Presentation Manager, and though I didn't take
notes there were some things I thought the Amigoids might be interested in.
Maybe this has been discussed to death in a thread that I haven't followed,
so I'll try to be very brief.

The demo was running on a ps/2 m. 70 with 6 MB of main memory.

Mainly what I want to describe is the user interface, and some simple ways
that it differs from Intuition.

Each window had its own menu bar, within the window. When the user clicks
a choice on the menu bar, a pull-down menu appears, with a default choice
highlighted. The user clicks again on his choice and the pull-down menu
goes away. The window is resized by dragging on any part of the border
in any direction. This looked pretty handy.

On the desktop, there was an ARRANGE menu, with choices Tile and Cascade,
which straightened up all the windows currenly open. This seemed pretty handy,
too.

At the desktop, there is an application that feels a lot like the PD
program, Browser. That is, windows showing the filenames in directories
which can be copied, renamed, deleted, or executed using mouse operations.
The use of icons seemed to be reserved for what Amigoids call an
iconofied window. That is, there is a running application, but if you don't
want its window cluttering things up, you close it. The application stays
resident, but the window turns into an icon. When you double click that
icon again, the windows reopen.

An interesting side effect of this is that icons have dynamic images. For
example, there was a clock program that runs in a window, but when it
is iconified, the icon, which now has a tiny clock face on it, continues to
keep time.

All in all, I was pretty impressed. Of course, I have no idea if it is a complete kludge underneath, but from what I saw it improved on the interfaces I know--Intuition, Mac, SGI (is that NeWS?).

>... After 16-20 meg of copying, it gets noticeably SLOW!

It may be slow, but good lord, not as slow as TOS 1.2!

The "slow" part is the first write to a new file. GEMDOS looks for the first free cluster in the FAT, always starting from the beginning. When there are 16 solid MB of allocated clusters, that's a lot of FAT sectors to check before finding a free cluster. On TOS 1.2, this is REALLY APPALLINGLY SLOW! On TOS 1.4, this is kind of slow. On TOS 1.4 with enough GEMDOS disk buffers to keep the whole FAT in RAM, it is REALLY FAST! Try Dfree on a 32MB partition in under 1 sec!

(Allocating the second, third, ... n'th cluster is not slow, because there the search begins with the previous cluster, not the start of the FAT.)

Ken Bad should have posted "CACHEXXX.PRG" here - if he hasn't, I'm sure he will. If you use it and be sure XXX is equal to the sum of the FAT sizes (in sectors) of your disks, GEMDOS will load them up once and never have to hit the disk for reading a FAT again!

It is not the case that the FAT is written after each allocation. It's written when a buffer is re-used or the file is closed.

Yeah, happened to my Seagate 251 as well. A local hard drive guru type person suggested that it might be a worn "spindle"; [this of course depends on what kind of hard drive mech the SH204 has] the little thing on the bottom of the hard drive that spins (middle of mech. approx.) and is covered by a tab. That occasionally gets worn, causing a wobbling that makes the sound.

In my case, however, the 251 was turning itself into dogmeat.

Okay, okay! I refrained from answering because I just don't have that much
experience with data bases. But I did buy Base2 by Antic a few months ago for
my simple-minded home database needs, for which it works just fine.

Strengths: GEM-based, uncomplicated, very easy to set-up the database
records and reports, even if you only use it occasionally. Fast, since the
whole database is loaded into RAM. The database record can be modified
even after entries have been made. Overall - fun to use.

Weaknesses: The size of the database is limited to the amount of available
RAM you have, minus accessories, TSRs, caches, RAMdisks, desk managers, etc.
For my uses on my Mega2, this will never be a problem. Biggest concern
for me is that the database is not compatible with any of the standard big
database programs, in case I ever want to upgrade to one.

Other: A friend that tried Base2 was not happy with report formatting, tried
DBman III (I think) and found it way too complicated, decided to roll his own.

Hope this helps.

Dealers are now receiving information sheets along with
their Rainbow TOS orders. If your dealer hasn't ordered
the new TOS recently he may not have it, but his contact
in dealer services at Atari Corp. will be happy to send
it to him.

In short the addendum addresses:

1. The file selector (expanded drive selector,improved wildcards).
2. Moving files by holding down [Control] as you click on and drag
selected files.
3. Skip option available for group copying.
4. Aborting group move, copy, or delete operation by holding
down [Undo].
5. Disks formatted are fully MS-DOS compatible.
6. The Install Applications option allows you select an application
to auto-boot.
7. Copy and Format dialogs have been combined.
8. Folders can be renamed.
9. The [Control][Alt][Delete] sequence will reset your computer.
The [Control][Alt][Right Shift][Delete] causes a cold boot.

1599. The *new* DC Squish from Double Click Utilities...

Newsgroup: comp.sys.atari.st
Date: 1989-10-13 22:00:52 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891013.16005173.072949@SFA.CP6>
Source record: 248221

One joy that a user-enthusiast has when receiving new
software is the observation of the evolving improvement of
already great packages.
I've already stated that Double Click's DC Squish is the
greatest thing since sliced bread. Well, add butter and milk to
the sliced bread, which was formerly dry before. DC Squish just
gets better and better! DC Squish has now been improved upon in
a quiet but major way.
We have talked about DC Squish and the PD/Shareware (???)
Packer before on this net. Packer, when it did work, generally
bested DC Squish in file compression. DC Squish, on the other
hand, was much more user friendly and a whole lot of fun to use.
The new DC Squish is just as friendly, just as dependable,
and more important, compresses files tighter than it formerly
did. Easily, it approaches and outdoes Packer. Briefly the following
list sums up the improvements and added options:

1. More compression.
2. Faster execution speed.
3. Automatic conversion from old DC Squish to new -- painless!
3. User options for widcarding and keeping original file names.
4. Automatic multiple file compression (user's choice).

Commands engaging the new features are easy and everything
is just, well, friendly.
Below is a brief list of file sizes for three programs.
Many cheers for DoubleClick. They treat us well. Please BUY
their products, folks. I want more utilities from these guys!!!
I've a feeling that this is just a taste of good things to come.

PROGRAM	ORIGINAL SIZE	OLD SQUISH	NEW SQUISH
Flash 1.60	137.492 K	106.222 K	97.220 K
Turbo 1.60	52.587 K	26.858 K	23.412 K
WordPerfect (Aug 89)	204.280 K	161.726 K	151.632 K

[Nope, I don't work for these fine folks. I'm just a very happy
buying customer.]

1601. Software for sale

Newsgroup: comp.sys.atari.st
Date: 1989-10-14 01:02:24 UTC
From: kerchen@iris.ucdavis.edu
Message-ID: <5622@ucdavis.ucdavis.edu>
Source record: 248223

Hello all,
I'm selling the following pieces of software (I don't use them
anymore). All of them are the original disks with the original docs
(and some are even in the original boxes!). The following prices
are in US dollars and include shipping to almost anywhere in North America.

Title Price Notes
==
Chat 2.0 $5 Communications by SST
Thunder! $10 Spelling checker by BI
Roadwar 2000 $10 Game by SSI
Brataccas $10 Game by Psygnosis
Wishbringer $10 Game by Infocom
Midiplay $10 16 Track midi recorder
Phantasie I $15 Game by SSI
Alien Fires $15 Game by Jagware
Music Studio $20 Music composition tool
Balance of Power $20 Game (politics)
Flight simulator 2 $20 Flight simulator by Sublogic
MCC Pascal 1.35.02 $30 Pascal compiler

I am willing to give a bulk discount if you're interested in more
than two titles. E-mail all offers/flames/etc to
kerchen@iris.ucdavis.edu

Thank you for your support.

Paul Kerchen | kerchen@iris.ucdavis.edu

1602. Re: Laser C bugs

Newsgroup: comp.sys.atari.st
Date: 1989-10-14 01:46:17 UTC
From: w-darekm@microsoft.UUCP
Message-ID: <8044@microsoft.UUCP>
Source record: 248224

Someone sent me mail about Laser C which I could not send back, so I
am posting this here for anyone else that's interested.

The code generation bugs are mainly in the inline assembler.
For example, the MOVEP instruction generates bad code. dc.l and dc.b
generate bad code (only dc.w works fine), branch statements sometimes
miss their target by a few bytes, etc. It's just an all round bad
assembler. The C code generation has some problems when you get
pointers to structures containing pointers, etc. What also irritates
me is that if you have a string constant and you forget to put in the
closing quotation marks, it crashes. All of these bugs have been present
since Megamax C, I keep reporting them, and they keep ignoring them or
telling me they're fixed. That's pissing me off to no end, because otherwise
I like the package a lot.

The disk cache tends to mess up when you are low on RAM and compiling a
large program (i.e. more than one module or more than a "hello world"
skeleton). The are more files than the disk cache can handle, and so it
starts to thrash very badly. The cache is a file cache, not a sector
cache, therefor if you are dealing with large files, say the LIBC.A library,
it has to flush out a large number of files before it can load the big file.
If your program has to deal with a large data file, such as converting a
24-bit RGB image to a Degas picture, which I used to do a lot, you have to
exit the Laser C shell and run the program, then re-enter it to make edits.
Trying to run such a program from within the shell results in a major slowdown
in disk speed. A file that would normally take a second to load from the
hard drive can take half a minute. I find that completely unacceptable.
Sure the cache is great if you're compiling off floppy, but you're not going
to develop a large project on floppy. The cache should be smart enough to
figure out that any drive letter C: or higher should not be cached.

> the ST.

I agree with you on Laser; it had promise, but the buggy code generation, incomplete library, and weird disk cache eventually caused me to give up on it. Fortunately, there is an alternative; the GNU C Compiler. It's a huge memory pig (you really need 2 megabytes to run it) but it produces very good code, is ANSI compatible, and now comes with an (almost) ANSI and Unix compatible library. And the price is right... it's free! (Source is available too, and it's being actively supported by the Free Software Foundation). The current version is 1.36, available from dsrgsun.ces.cwru.edu and (I think) terminator.

>anyway. I have a thought, would it be possible to interface an ST to an IBM PC
>with a tape backup?? More folks out there might have access to such a creature.

Did you look at the code? I wonder how well it would run over a
telebit to a unix host (in xmodem mode instead of uucp mode).

I had given some thought of doing something like this for a PC. The
machine in my living room has 2 337MB drives, but the one in the
kitchen does not have a drive for DOS. I am not familiar enough
with the ST to even think about doing what Paul has done. The C
portion may be able to be ported to a PC allowing the PC to serve
the ST. I tried Paul's program connected to a 286 running Xenix
and all i get are "Chksum reading block 0" and then "Timeout"
errors. Has anyone been able to get this working on a ST talking
to a 286 or 386? I tried running it at 4800 baud with the exact
same results, the only thing i can think of is that the data that
the ST requires is byte swapped.

I have been giving some thought to using Paul's Unix partion of the
code to serve to a DOS machine allowing the same server software
to work with both the ST and PC. Anyone interested in swapping
ideas? Please respond via mail if you are, or know what the problem
is with running the C portion on a 286.

Is there a simple Backup program that works on a 520ST? The ST's
hard drive was dropped and i did not have a backup, hence my desire
to get pmfs working.

Source record: 248232

Wayne Schellekens asks:

>Does anyone have any information as to how DEGAS compresses its
>picture files?

The original DEGAS program didn't compress it's picture files at all..
they are the ones with the .PI1, .PI2 and .PI3 extensions..

DEGAS Elite *did* compress its files.. the ones with .PC1, .PC2 & .PC3
extensions...

David Baggett has posted a text file now and then, containing the most
popular graphics formats, and how exactly they're implemented.. his ARPANET
address is: dmb@TIS.COM if you'd like to try to contact him..

His file "ST Picture Formats" may be available on the ST archives, or I know
it's available on CompuServe.. (since I uploaded it there)

In addition to DEGAS, it includes several other graphics file formats..

> With all the usual talk of "Atari's blown it again, etc., ad nausem"
>from many on this net, including myself, it might be refreshing to know
>that product is arriving, at least in this little neck of the woods, this
>IBM and Mac world that I live in.

...

> Anyway, I think the door is beginning to open.

Yes... but... the door to what...?

I agree that the Portfolio is not "vaporware", but then again, what exactly
IS it..?

Is it something that will benefit Atari ST owners..? No..

Is it something that will help promote the Atari ST name in the computing
industry...? No...

Is it something that will be of use to anyone other than owners of IBM PC
and PC clones..? No... (not unless you can justify a $400 "phone list")

Is it a "standalone" computer..? No...

Is it an economical answer for someone wanting to get into "computers"..?
No...

So... what exactly IS the Portfolio...?

As I see it, the Portfolio is an accessory for an IBM PC system... much
like a fancy monitor stand, or a gizmo that holds papers for you to type
into your text editor... it WILL help you do things like taking notes
on an airplane, or entering "travelling salesman" figures "on the spot"...
but... that seems to me to be an awfully limited usefulness..

If you DON'T have an IBM PC style system, a Portfolio is an expensive toy...

No, it's NOT "vaporware"... but neither is the $50 gizmo that makes peanut
butter in your kitchen... who needs it..?

1612. Input thru parallel port

Newsgroup: comp.sys.atari.st
Date: 1989-10-14 07:02:28 UTC
From: SCHWIETZ@DBNUOR1.BITNET
Message-ID: <8910140702.AA02424@ucbvax.Berkeley.EDU>
Source record: 248234

Could somebody please explain whether there is the risk of damaging
the soundchip when an output signal from a TTL-compatible (no tri-state
or open-collector) device is directly fed to the printer port?

As far as I know, the printer port is switched to output
mode during system initialization. Therefore, there is a good chance that
the port lines are tied to different voltage levels until the port
is explicitly switched to input mode.

I'm using a A/D converter directly connected to the printer port
without any problems so far. Nevertheless, I'd like to know what's
going on ...

1614. Re: pack and speed of execution

Newsgroup: comp.sys.atari.st
Date: 1989-10-14 07:05:23 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <23089@cup.portal.com>
Source record: 248236

George Ng asks:
>Does the pack compression program slow down the execution of a program?

No... PACK doesn't affect the execution speed of a program at all..

Essentially what PACK does is to create a "self dissolving" ARChive of
a program... when you load it, it "unPACKs" itself into memory, and
becomes the same as if you'd loaded a normal version of the program..

In addition to the savings in disk storage space, LARGE programs may actually
load FASTER when they're packed... this is because the smaller PACKed
file loads in less time than the original file does, and the unPACKing takes
place in RAM, which is very fast...

Probably the best answer would be for you to try it yourself and see how
it works for you...

Keep reporting them. I would too, if I found any. But mostly
I find my own bugs. No implication implied.

>
>The disk cache tends to mess up when you are low on RAM and compiling a
>large program (i.e. more than one module or more than a "hello world"
>skeleton).

I assume the parenthetical remark to be slightly sarcastic, but
your argument about low RAM behaviour makes sense to me (I
have a Mega2, so this is never a problem). I agree
with an earlier posting in which you suggested that
the cache be optional.

>Sure the cache is great if you're compiling off floppy, but you're not going
>to develop a large project on floppy.

Why not? The disk cache and RAM resident tools make this
completely reasonable. A little painful at the start of
a programming session (and after unrecoverable errors),
for sure, but certainly not completely unthinkable.
Especially for those (i.e. me) who (perhaps) misguidedly

purchased a machine with more RAM instead of a hard disk.

I am not a real C programmer, that is, I don't spend months
working on real projects (in fact, I'm a Prolog hacker
`by trade' :-) and my Mega2 is somewhat ignobly
reduced to a real slow terminal for most of its use)
so I consider one-floppy development adequate for my
medium sized hacks ---but only with the cache, etc.

>Peter Szymonik
>Xorg@cup.portal.com

As far as PC Speed vs. PC Ditto II I think PC Ditto II will be a better product. PC Speed is only going to support CGA. They are working on 16 color EGA for PC Ditto II-and you will get 16 color EGA out of your standard Atari SC1224 monitor. The price for PC Ditto II is $299. I think the EGA option (which, by the way, they say will be the only other addition to the PC Ditto II board) will cost extra. The original PC Ditto II release will not have it.

Can someone reccomend a decent small-sized (under 50k) GEM-based text editor for me? Preferibly in .ACC format, but not necessary. I've been looking around for something like this for the last week, and all I've been able to find is an ACC called DIARY that has a STATIC buffer size of 8k, and then something called PEDIT which took up 100k and didn't even have a GEM interface.

HelP!

1620. TOS 1.4, memory chips, T16...and the Mega2 STs

Newsgroup: comp.sys.atari.st
Date: 1989-10-14 17:32:06 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891014.11320557.073300@SFA.CP6>
Source record: 248242

Can anyone shed some light preparing a Mega2 ST that has six ROM
sockets for use with the T16 and upgrading the Mega2's memory to four meg?
I've been reading conflicting data about what brand and speed memory
chips to use if one wants to use the T16. I've also been reading that
the T16 is happier if used with fast ROM, that is, copying the original
TOS 1.4 EPROM into faster EPROM chips.
Also, should the older 'Atari' blitter be replaced with the newer?
Incidentally, the 74LS373 chips have been replaced. I had problems
with Spectre until they were.
SIGH...this is a terribly worded letter. Basically, I'm only
asking:

1. What memory chips should be used for upgrading the ST2 to a ST4
if used with the T16?
2. Should the chipped TOS 1.4 be transferred to fast EPROMS to gain
maximum results from the T16?
3. Should the Atari blitter be replaced with the newer?
4. Yes, the 74LS373 chips have been replaced.

Introductory information
----
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special
information there (most notably Art Studio).

The Formats

<NEOChrome>

1 long resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
12 bytes filename (" . ")
1 byte Left color animation limit (starting color number)
1 byte Right color animation limit (ending color number)
1 byte color rotation speed
1 byte color rotation direction
1 word color rotation duration (number of iterations)
18 longs reserved for expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOChrome Animation>

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click the right mouse button in the eye of the second R in
the word GRABBER.

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of sprite in bytes (always divisible by 8)
1 word height of sprite in scan lines
1 word size of sprite in bytes + 10 (!)
1 word x coordinate of sprite (must be divisible by 16) - 1
1 word y coordinate of sprite - 1
1 word number of frames
1 word animation speed (larger means slower)
1 long reserved; should be zero
----
44 bytes total for header

? words sprite image data (words of screen memory) for each sprite,
in order

<DEGAS>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)

```
-----------
32034 bytes total

<DEGAS Elite (Uncompressed)>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]
-----------
32066 bytes total

<DEGAS Elite (Compressed)>

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control bytes
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]
-----------
< 32066 bytes total

Control byte meanings:

For a given control byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-127 <= x <= -1 Use the next byte -x + 1 times
-128 No operation (ignore)

Compression Scheme:

Each scan line is compressed separately; i.e., all data for a given
scan line appears before any data for the next scan line. The scan lines
are specified from top to bottom (i.e., 0 is first). For each scan line,
all the data for a given bit plane appears before any data for the next
higher order bit plane.
To clarify: The first data in the file will be the data for the lowest
order bit plane of scan line zero, followed by the data for the next higher
order bit plane of scan line zero, etc., until all bit planes have been
specified for scan line zero. The next data in the file will be the data
for the lowest order bit plane of scan line one, followed by the data for
```

the next higher order bit plane of scan line one, etc., until all bit planes
have been specified for all scan lines.

<C.O.L.R. Object Editor Mural>

16000 words picture data (screen memory)
(palettes are stored in separate files)

32000 bytes total

<Tiny>

1 byte resolution (same as NEO, but +3 indicates rotation
information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits
hold left (start) limit; low 4 bits hold right (end)
limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

1 word number of control bytes
1 word number of data bytes
16 words palette
3-10667 bytes control bytes
2-32000 bytes data bytes

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 long is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

<Spectrum 512 (Uncompressed)>

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

```
-----------
51104 bytes total

<Spectrum 512 (Compressed)>

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map
--------------
< 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme. The
data map is stored as a sequence of records. Each record consists of a
header byte followed by one or more data bytes. The meaning of the header
byte is as follows:

For a given header byte, x:

0 <= x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x < 0 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included; i.e., stays
the same). The least significant bit of the bit vector refers to
palette entry zero, while the most significant bit refers to palette
entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette
entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the
background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

<Animatic Film>

1 word number of frames
16 words palette
```

```
1 word speed (0 - 99; higher value is faster)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse
1 word width of film in pixels
1 word height of film in pixels
1 word version number (major)
1 word version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved (should be all zeros)
--------
32 words total for header

? words image data (words of screen memory) for each frame, in order

<MacPaint>

header {
1 long version number (if zero, entire header is ignored)
38 * 2 longs pattern data (anyone know how to use this?)
51 longs reserved
}
< 51200 bytes compressed bitmap data
-------------
< 51716 bytes total

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel image. The data is
stored as a sequence of records. Each record consists of a control
byte followed by one or more data bytes. The meaning of the control
byte is as follows:

For a given control byte, x:

0 < x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= 0 Use the next byte -x + 1 times

There are 72 bytes per scan line. Each bit represents one pixel; 0 = white,
1 = black.

1622. 520STFM FOR SALE (w/many xtras)

Newsgroup: comp.sys.atari.st
Date: 1989-10-14 20:21:58 UTC
From: geoffs@smoke.BRL.MIL
Message-ID: <11292@smoke.BRL.MIL>
Source record: 248244
Cross-posted to: comp.sys.atari.st,dc.forsale

FOR SALE: Color Atari 520STFM SYSTEM w/RAM board upgrade.
(also w/PC DITTO and 5 1/4" floppy!)
(software and over 50 disks!)

$600 plus shipping.

Atari 520STFM system includes:.
Color monitor (SC1224).
EZRAM II board - 1 to 2.5 meg RAM upgrade.
Late model (only 2 years old)-(Rev.H) includes Television RF output.
External SS 400K SF354 3 1/2" floppy disk drive.
NEW External DS/DD 360K I.B. DRIVE 5 1/4" floppy disk drive.
TOS in ROM, Atari Basic, DR Logo., and of course GEM in ROM & mouse.

Lots of software
Utilities:
PC DITTO
PRINTMASTER PLUS
HIPPO WORD
ST LEDGER
Original Atari Development System Documentation & Utilities.
(plus C Compiler updated to ver 4.14 1986).
GAMES
FLIGHT SIMULATOR II (Plus east coast Scenery Disk 7).
HARRIER STRIKE MISSION (needs $5 disk replacement).

I will through in:
OVER 50 disks!!! PD or Shareware software. Archived and indexed.
includes:
UNITERM(using now),MICROEMACS 3.91/4,Compilers,Drawing...more.
HACK,LARN,RISK,MONOWARE,WHEEL OF FORTUNE,... too many to name.
3 Flip File dust cover 3.5 disk storage containers.
16 256K DRAM chips (enough for 1meg upgrade).
[Some of these chips are flakey so they are not
included with the RAM board. I don't have a
chip tester to pick out the bad ones. Maybe it
can be done in software?]
All items shipped in original boxes with manuals.

From: Xorg@cup.portal.com
Message-ID: <23106@cup.portal.com>
Source record: 248246

I don't think that my problems are related to the 'weak chips', all programs now run fine, now my only problem is with booting the system. After a long search I think I've narrowed the problem down to either a bad .ACC or a problem with the ICD adaptor board, the system is in for a look-see at my dealer now - the diagnoistic cart showed no problems with the Mega 2. (murphy's Law, bring it to a dealer and it will work fine!)

Peter Szymonik

To sample the state of either mouse button, use the AES function graf_mkstate. As I don't have my GEM manual with me now, I don't remember exactly how it works, but this function returns the state of the two mouse buttons as well as the shift, alternate and control keys.

Ciao... Eric Ruck

1630. Games for Sale

Message-ID: <1989Oct15.062847.22227@agate.berkeley.edu>
Source record: 248102

Hi there. I have a couple of games which I don't play anymore
which I would like to get rid off. Everything has the orginal docs and boxes
except dungeon master(no box). All the prices include shipping...also make
me offers on bundles of the games....

Barbarian $5
Death Sword $6
Tracker $6
Barbarian II $15
R-Type
$15
Shadowgate $10
Impossible Mission II $10
Carrier Command $12
Heroes of the Lance $10
Empire $15
Dungeon Master $10

I would part with the whole lot for $90.

Thanks!

Use DecpacST/2 as assembler instead! It can produce either DRI or
GST object files. And I find Decpac being one of the best packages, too.
It's quite cheap, fast, easy to use and has a wonderful debugger!

And I think that MWC can produce DRI format files, but I'm not sure.
Maybe Alcyon C?

Too lazy -- or simply to demanding. The .IMG-format is too complex,
to strange, requires to much effort to use. At least that's my opinion.

>Yes, IMG is supposed to support colour too.

Hey, how do you know the colors? As far as I know, there are no
way of specifying the palette data. Only the number of bitplanes.
Am I wrong?

Regards,
Daniel

PC Ditto v3.01 will NOT work with TOS 1.4. I forget what the error says, but I think it was something like: "Does not work with this version of TOS" or something to that effect. Too bad there isn't a way to piggy back the two versions of ROMs and have a hardware switch between them. That is why I dislike system software being in ROM. It is so much easier on my Big Blue PeeCee. If something doesn't work in DOS 3.3...FINE...I boot up with DOS 3.2 or 3.1 and it works fine.

1635. TOS problem ?

Newsgroup: comp.sys.atari.st
Date: 1989-10-15 15:29:10 UTC
From: piet@cs.ruu.nl
Message-ID: <1708@ruuinf.cs.ruu.nl>
Source record: 248107

I encountered a strange TOS behaviour (TOS 1.2):

I Fcreate a file, then Fopen the same file (not very usual, I agree). I get two filehandles of course. I only use the second one, and write some bytes to the file. Finally I close the second handle, and forget to close the first one, (or close that last). Result: an empty file. If the first filehandle is closed first, no problem.

My guess is that the close on the first filehandle (either implicit or explicit) remembers that nothing has been written on this handle, so the file should be empty (???)

Note: the compiler has long ints (GCC).

Any comments? Is this a bug? Here is the program:

```
------------------------------------------------------------------------
#include <osbind.h>
char fname[] = "test.fil";
char message[] = "this is a line\n";
main()
{
int fd1, fd2, r;

fd1 = Fcreate(fname, 0);
fd2 = Fopen(fname, 1);
r = Fwrite(fd2, strlen(message), message);
printf ("fd1=%d,fd2=%d,result=%d\n",fd1,fd2,r);
Fclose (fd2);
Fclose (fd1); /* or just delete this line */
}
------------------------------------------------------------------------
```

1637. PC-DITTO NOT READING DIRECTORY OF PC-FORMAT DISKS WITH *.BAS FILES

Newsgroup: comp.sys.atari.st
Date: 1989-10-15 17:06:24 UTC
From: ia4@CUNIXD.CC.COLUMBIA.EDU
Message-ID: <8910151706.AA14294@cunixd.cc.columbia.edu>
Source record: 248109

PC_DITTO CAN'T READ DIR OF DISK : WHY ?
- - - - - - - - -

I know for a fact that PC-DITTO works perfectly as a PC emulator but recently I had the following problem.

I downloaded some *.BAS (BASIC) PC files from the school network for homework assignments. These were on a 3.5" disk that I tried to run under gwbasic under PC-Ditto. FILE NOT FOUND is the message I got.

I quit basic and at the A: prompt asked for a directory of the disk.

FILE NOT FOUND again, though it showed only 60K space remaining on the disk.

All the other PC format disks work perfectly and give complete directory except the *.bas ones. (The files are also visible under GEM).

I also tried copying the files to another disk but the same result occurred.

I tried saving an additional file onto the same disk from an ST application and getting "dir" under PC-Ditto shows that ONE file only. The *.bas files are still invisible.

I took the disks back to school and checked them on the PCs there. The files are all visible under the "dir" command. So what could be the problem?

Solution?

Thanks for your help.

Imran Anwar

A few days ago, I promised to post an article demostrating how to
use Regent Software's SQL Add-On with C. Sorry for the delay -
my ST was at my dealer getting TOS 1.4 installed (yay!).

I needed a cheap database for a school project, and I found SQL Add-On
in E. Arthur Brown's catalog for $24.95. I preferred something I could
use with Mark Williams C, but decided that GFA Basic would be OK.

The SQL Add-On works well, but the documentation is not great and the
SQL is not standard. Syntax is slightly different and it has a funky
way of dealing with queries returning multiple rows. However, the
price is right.

Regent claims that files are compatible with RegentBase. It is
supposed to work with GFA Basic V2 and V3.

The Add-On is a terminate-and-stay-resident program (TSR). It loads
the SQL processor and adds a new xbios call (xbios(500)). It takes up
over 300 K of ram (buffers, I guess).

To use the Add-On, run the TSR program first. Use GFA Basic's xbios()
call to call xbios(500). This returns the address of the SQL processing
function. The GFA Call function is then used to execute SQL statements.

I reasoned that there is nothing preventing me from doing the same thing
in Mark Williams C. In C, if you know the address of a function, you
can call it.

By reading the GFA Basic and MWC manuals, and spending some time with the
MWC debugger, I worked it out. The SQL function expects two arguments
on the stack:
number of arguments (int, on top of stack)
arguement buffer (pointer to array of pointers to char buffers)

Below is a sample C program with comments. Feel free to email if you have
questions (email may no work - post here or use snail mail in that case).

*/

#include <stdio.h>

main()
{
/* pointer to function */
typedef void (*PFI)();

extern long xbios();

/* sql is a pointer to a function returning void */
PFI sql;

/* these char arrays hold arguments for the sql call */
/* fields */
char field1[21], field2[3], field3[21];
/* error code */
char error[10];
/* command string */
char command[100];

/* this array will hold pointers to the command, error and field
arguments. Make the array larger if more fields are used. */
char *args[5];

/* the first field in the array points to SQL command string */
args[0] = command;
/* second points to a buffer used to return error codes */
args[1] = error;
/* all other fields point to buffers where the column results
of a query will be placed - one buffer per culumn returned */
args[2] = field1;
args[3] = field2;
args[4] = field3;

/* A program is run before the SQL Add-On can be used. It
loads the SQL processor and creates a new xbios call.
The new xbios call returns the address of the SQL processing
routine. */
sql = (PFI)xbios(500);
printf("sql = %U\n",(long)sql);

/* This program assumes that a table has been created using the
SQL statement
CREATE TABLE phonelist name CHAR(20), age INT(2),
phone CHAR(20);
```

```
and some records have been added. The demo program included with
the product (written in GFA Basic) will do this. */

/* set up the command string - SELECT [1] is Regent's funky
way of setting up a cursor */
strcpy(command,"SELECT [1] * FROM phonelist;");

/* Call the SQL processor. The function expects to see the
number of arguments on the top of the stack, followed by a
pointer to the argument array.
*** WARNING ***
This is compiler dependent!! Mark Williams C pushes arguments
right to left. Your compiler may differ. If so, reverse the
order of the arguments and it should work. */

(*sql)(5,args);
printf("error: %s\n",error);
printf("%s %s %s\n",field1, field2, field3);

/* execute another commend to retrieve the next row.
SELECT NEXT is Regent's funky way of dealing with cursors */
strcpy(command,"SELECT NEXT * FROM phonelist;");
(*sql)(5,args);
printf("error: %s\n",error);
printf("%s %s %s\n",field1, field2, field3);
}

1639. Laser C and FAST Problems

Newsgroup: comp.sys.atari.st
Date: 1989-10-15 19:16:59 UTC
From: jjung@nunki.usc.edu
Message-ID: <5784@merlin.usc.edu>
Source record: 248111

I have a question for all you hard drive and Laser C owners out there.

Recently, I got an ICD FAST 50 meg hard drive. It performs fine, with the exception that I can't run any software off the floppy (a 1040STfm) unless the hard drive is on, and I disable the HD (using Shift-Control-Alt). Other people have told me that the controller is a little flaky for this reason, but I'm not worrying about it much, because it's only a slight hassle.

Now for my problem. I have Laser C 2.0 on the hard drive, and I use it fairly frequently. The problem is, whenever I do hard drive access with Laser C, occassionally, the mouse will die on me, in that I can't move the mouse pointer. Sometimes, the mouse's death is only minor, and I can use the keyboard controls to control the pointer and leave Laser C, and sometimes the death is major and nothing will move the mouse, in which case I simply have to reboot the whole system.

I have noticed that before the mouse dies, a string of characters (same character in the string, but not the same character all the time) comes out on the active Laser C window, and then Laser C pops up a dialog saying that I should hit a key that is recognized by Laser C. Then the mouse dies.

The mouse dying only happens with Laser C and not with other programs I use, like Flash! or WordUp!.

I use Superboot 5.5A along with the other ICD utilities (clock and boot up program) to boot up my system. Also, I have no busy light (I can't get it to work), and the hard drive seems to do occassional disk access, but I'm not sure.

What I want to know, is : Is this problem with Laser C common with other HD users? With other FAST users? Or is it that my HD controller is flakier than I thought, and that's what's causing all the problems (HD has to be on, to run floppy, random HD access, and Laser C mouse death)? Or do I have an HD virus?

Please post or E-mail and help you can give.

John

1640. Problems with LASER C 2.1

Newsgroup: comp.sys.atari.st
Date: 1989-10-15 19:22:12 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <1588@quiche.cs.mcgill.ca>

Anyone else have this problem:
Whenever I use the "goto line" function or the "find" command from the shell I loose the mouse pointer.. THat is, it's there but I can't see it.

I gotta run another GEM program which switches the pointer back on before I can see what I am doing.

grrr. how frustrating. I can't wait to get PC-Speed so I can run f*cking Turbo C. I sent a letter to Megamax. I will tell you how long they take to reply to it...

1641. disassemblers

Newsgroup: comp.sys.atari.st
Date: 1989-10-15 19:57:45 UTC
From: daniel@pkmab.se
Message-ID: <2060@pkmab.se>
Source record: 248113

What disassemblers are there for the ST? I heard something about a new german logical disassembler, and that it probably wasn't worth the price to convert it to english.

I'm looking for a disassembler that can able to do the following things:

o Disassemble from a file, with symbols.
o Generate labels.
o Recognize illegal instructions and set these to dc.?
o Generate code that can directly be assembled again.
o .PRG, .TOS, .TTP, .O, .BIN, etc should be handled.
o Specification of data-areas should be possible
o Hex-codes as a comment as an option
o character strings as comments as an option
o ...several other things I don't remember right now :-)

The only one I've got is the 'built-in' disassembler in GenST, and it has errors...

Are there any disassemblers with sourcecode avaiable? Then it should be no problem changing the format of the output.

Please e-mail any response to me, or post it to the net.
Daniel

It's no kludge - and all the stuff mentioned in the article is also
possible on PC's running DOS and Microsoft Windows.

Also watch out for Microsoft Windows 3.0 ... and last not least HP's
NewWave, an object oriented window environment using MS Windows.

Well, my dealer didn't give me anything that descibed the new features. All
I got were my ROMs and a photocopy of the sheet showing what changes to make
to the Mega mother board to install the six chip set into a two chip system.
And that was just a schematic drawing.

Could someone PLEASE post a copy of the documentation for TOS 1.4 to the net
or mail me a copy and I'll post it.

[Sigh! This one turns up often enough to be included on a list of
commonly asked questions, did anybody ever do something about this?]

Your best bet is to install your own vdi mouse button handler, save
the "incoming" button mask in a variable and replace the original value
(if I remember correctly it's in d0) with the value for the left button.
After you've done that jump to the original button handler, the whole
thing needs just a couple of assembler instructions, so it's really
trivial. In your event loop just wait for a left button event and then
sample the stored value for the button that was really pressed.

I've come across something that seems strange to me that I hope
someone can offer some advice about.

I have a GEM program that reacts differently whether a hard drive is
is in place or not!?!?!?!?!?! If the hard drive is allowed to boot
then this program runs fine whether I run it from floppy or the hd.
If the hd is not allowed to boot then this program will bomb at a
certain point in execution.

Can anyone offer any possible reasons why this would happen?

The only possibility I can come up with is that the hd
booting causes the program in question to be loaded into
a slightly different area in RAM. Without the hd booting
the program in question could be violating some sort of 32K
boundary with its reference to a variable or a function.
With the hd booting might cause both the referencing area
and the referenced area to be in the same 32K block of RAM.
Does this sound far-fetched?

>reply to it...
It's really funny, because Turbo C for the ST already exists for almost a
year now. It is available from Heimsoeth in Germany who have an agreement
with the Turbo company in the USA. They use the parser from the PC version
and made their own code generator.
At this moment version 1.1 is released with support for the f68881 floating
point coprocessor. In december they release a sourcecode level debugger.
I have heard that these products are not sold in the USA, it is time
this will change, because it produces the fastest code of all ST C-compilers.
I have used a lot of them (Mark Williams, Lattice, Laser, GNU CC) and they
all compile slower and they produce slower code and larger code.
I use it all the time, and being developer of the image processing package
AIM, I know how nice a package it really is.
I have no connections with Heimsoeth in any way. I'm only very enthousiastic
about their product. It is also very cheap. In Germany it sells for 225 DM,
which will be roughly $ 100,-. This is the smallest version, without an
extra assembler. With assembler (the developers version) it costs 340 DM
($ 160)

I hope this gives a little more attention to this compiler, which deserves it
completely.

Robert.

The most powerful data-base manager is DbMan. Along with that go ridiculous
amounts of disk usage and access, the most pathetic user interface I've ever
seen on an ST (it's almost as bad as most PC based applications), and a
small number of bugs - some fatal - all work-aroundable.

DbMan is usable if you have a hard-drive, at least one meg of memory,
Turbo ST 1.6, and have used a PC extensively, or alternatively
you periodically hit your head against hard objects.

The only reason to buy it, is that it offers the most power to the user
of all the data-bases I have any experience with. Try before you buy.
(Also read a magazine review and get a look at the manual). I paid
$150.00 for the thing.

Twice I have postted distomwc, which is PD, and derived form another PD
called dis.

"... with symbols". distomwc only accepts DRI symbols. Every compiler
has its own symbol format. I found that what I wanted to disassemble
didn't have symbols anyway.

distomwc does the rest. Its output is MWC assembler compatible.

If you are a MWC fan, remember to save your 2.0 version of as. call it oas.
the 3.0 version doesn't know what to do with a ".s" short branch.

distowmc allows use of a control file that supplies symbols, and marks
as words or ascii, sections of .text.

What I do:
A. disassemble , and look at the resulting file.
Identify the embedded .ascii, and .words and put the areas into the control
file. (.ascii makes reams of strange instructions; .words can through off
the decoding of the next instruction).
B. disassemble again.
C. assemble it, and deal with the errors:
they are usually:
1. form 0x426:s ; MWC as will handle only NAMES, name:s. create names.
most of the references are to ATARI system variables any way.
2. Backward references from switch statements, where a list of addresses
show up in .data pointing to .text that does not look like the start
of code. (no preceding jmp or rts). Add the symbols.
3. Some references to odd byte offets in data or (oh no) .test itself.
add and equate to the real symbol.

D. when assembly is clean,
E. ld it (-s) to produce s .prg that should resemble the input.

some simple tools:
1. modify cmp to subtract the haeader (0x1c) from addresses.
2. print the relocation table as addresses.
3. remove mwc 3.0 debugging info from ld output.

F. first I compare the relacation tables.
G. when relo is ok, remove the debugging info, and cmp the files.
This should be very clean.
1. one thing showing up is move.b $0xff,d0, this type will have
DRI generate 00FF as the constant word, MWC generates FFFF.
Both work, but show up in cmp.

Howard C. Johnson
ATT Bell Labs
att!lzaz!hcj
hcj@lzaz.att.com

Scan the .prg for obvious ascii strings.

Turbo C will not be available for the Atari ST in the USA, as
Borland has no plan to sell this product in the USA market. I
remember Borland even denied the existence of ST Turbo C. As far
as Atarians in the USA are concerned, Turbo C is not a product, so
forget about it. Thus
we only have choices between Mark W. C and Laser C.

1659. Fonny diskdrive

Newsgroup: comp.sys.atari.st
Date: 1989-10-16 15:11:25 UTC
From: jackin@utacs.UTA.FI
Message-ID: <757@utacs.UTA.FI>
Source record: 248131

My friend has a -86 or -87 1040 ST. He has only one diskdrive (internal one)
and it has been acting fonny lately. Maybe this has something to do with the
fact that Diskdrive can write WriteProtected disks. It (dd) fails to recognise
any writeprotected disk as writeprotected we feed it. I remember some postings a while a go
concerning dd failing to recognise media change. My friend has
that problem too. He is quite handy with electronics and he hopes to repair dd himself.

Has anybody done this himself or can anybody give hints where to look (yeah,
we might start by looking inside the dd, right ;->). Any responses welcome.
Thanks.

Darek, if you could send me the C code that breaks LASER C 2.1 I would like to compile it with Mark Williams C 3.09. I could send you the results, and you could determine if MWC is a better choice for you.

Also, a local frined has the Prospero C compiler, and I could get your sample compiled on it as well.

So, please don't give up on C until you have tried MWC or Prospero.

>HelP!

There is a GEM-based desk assessory editor called STEDT (?) from Canada.
It has a nice GEM interface (even pull-down menus attached to the
window). There is a demo version going around with save disabled.
However, if you use the clipboard feature (this is the only ST
program so far I know which supports the standard GEM clipboard) you
can paste all your text to disk in the file "scrap.txt". It is a very
nice editor.

1662. ST in USSR

Newsgroup: comp.sys.atari.st
Date: 1989-10-16 15:28:35 UTC
From: jackin@utacs.UTA.FI
Message-ID: <758@utacs.UTA.FI>
Source record: 248134

I have just read the article 'Computing in cold' (something like that)
in October PCW (Personal Computer World). I have thought of USSR being
a very attractive marketing place for Atari ST. The writer (don't remember
his name) told that ATARI (the company) missed a big chance to make ST
de facto in Soviet schools. That's sad. Has any one more information
about this ? I can't see any reason why Atari still couldn't make it
big in the USSR. If Atari is going into the American market in a big
way in -90, why not USSR as well (competition shouldn't be too fierce :-).

Just a thought. Any comments any one ?

1664. Rainbow TOS - I'VE GOT IT!

Newsgroup: comp.sys.atari.st
Date: 1989-10-16 17:00:41 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440064@hplsla.HP.COM>
Source record: 248136

My dealer (Cave Creek, Seattle, WA) installed the new Rainbow TOS ROMs in my Mega ST2 last Friday and I picked up the machine Saturday. Cost: $100 plus tax. The machine booted up perfectly and ran all weekend. I used all my applications, and I threw out half my AUTO progs - including, finally, STARTGEM, FATSPEED, and FOLDRXXX! (Hooray, hooray, and hooray!)

NO PROBLEMS - REPEAT - NO PROBLEMS ENCOUNTERED!

Along with the new ROMs, I got an official Atari flyer entitled "Rainbow TOS Addendum" which is 4 pages long. It details the new features of Rainbow TOS (but no details about the bug fixes).

My biggest impression thus far is that the problems with hard disk FATs is fixed (and how). My machine used to take up to a minute to boot, what with SUPRBOOT renaming files before FATSPEED was loaded. Now, it boots in about 10 seconds, and that's with the ICD cache installation, NEODESK and G+PLUS!

From: depeche@quiche.cs.mcgill.ca
Message-ID: <1589@calvin.cs.mcgill.ca>
Source record: 248137

In regards to a speedup program for the OLD tos which makes hard disk access faster, I have a program called TURBODOS by Dominique Laurent and Atari France (dated March 3, 1988).

This program supposedly fixes lots of bugs in the November 1985 release of TOS, and it also supports a cache, and makes things much faster. I like it.

My only problem with it is that it is not compaible with NeoDesk. If I have both installed I get erratic crashes and bizarre mouse stuff (sometimes keys get logically locked, and sometimes the mouse pointer generates keystrokes, sometimes I just lose the pointer entirely).

Does anyone else know of a program similar to Turbodos which works under NeoDesk? I plan to get the 1.4 ROMS soon but don't have them yet.

|
|Is it something that will help promote the Atari ST name in the computing
|industry...? No...
|
| (and other rhetorical questions deleted...)
|----------

Well, based on what I saw at my Atari dealer Saturday, it's something that is getting one heck of a lot of people to come in to the store that might not otherwise visit. My dealer didn't seem to be the least bit unhappy about having people lined up to look at the thing! Funny how people looked at the ST systems while they waited - obviously something they had not done before. The dealer just hired a new saleperson - between the increased traffic thru the store and the TOS 1.4 installation, two people can't keep up with the demand!

1670. Problems with STDCAT 4.3 and 4.0

Newsgroup: comp.sys.atari.st
Date: 1989-10-16 18:03:50 UTC
From: MBERNAR@ERENJ.BITNET
Message-ID: <8910191633.AA03973@ucbvax.Berkeley.EDU>
Source record: 248142

I tried using STDCAT 4.3 and ran into problems when I tried to print
my catalog. Everytime I tried to print disk #34, it returns to the desktop
with 4 bombs. The same thing happens when I click on disk #34 to view its
directory. I don't think it's a disk problems since I can succesfully copy
the catalog file without any errors. I've also tried a new catalog
file with the same result.

Using STDCAT 4.0 to read the catalog file from 4.3, results in 3 bombs. When
I created a new catalog file with 4.0, the same 3 bombs result when selecting
or printing disk #34.

I deleted a disk before #34 (#11 to be exact) and found that I could now access
disk #33 which used to be #34. But, the new disk #34 (used to be 35) now gives
bombs.

Is this a bug, incompatibility or hardware problem? I have a 6 month old
1040stf which came with the "mega" roms, running in high rez mode.

Regards,
Marcelino Bernardo

Message-ID: <891016190627.373581@DMZRZU71-UNI-MAINZ--GERMANY>
Source record: 248145

Hi,

recently Allan Pratt told us about the existance of a FAT-Cache called CACHEXXX.PRG. I have seen an early version of this program (supplied with the first beta release of TOS1.4) running. It speeded up disk accesses very significantly compared to standard TOS1.4. So, I am eager to have the final version of the program. But there are two big problems:

o where to get it.
oo adjusting the XXX correctly.

According to Allan, XXX must be exactly equal to the size of the FAT. How do I compute XXX exactly? What happens when the FAT size (in kB) is not even? Example: my Seagate ST296N (slowww) contains 4 partitions of 21.2 each. Their FATs take 81 sectors (1 sector = 0.5 kB), hence 40.5 kB. Do I have to take into account the sizes of all the inactive logical devices (floppies, hd partitions), too? (I run AHDI 3.01).

Another example (taken out of the WINCAP description for the Megafile 60): 2 partitions of 30 and 34 MB. How to do this?

Related question: is it possible with tos14 to increase the cluster size, i.e. shorten the FATs dramatically and thus speed up the hd even further? Will CACHEXXX support such a configuration? If this is possible --- how can I do it? Can I use Supra's SUPEDIT for this purpose?

Of course, comments of Atari officials on this subject are appreciated very much.

Thanks

Michael Ritzert

|Does the ST use a standard printer interface ?

Yes! (But I don't recall which one at the moment...)

|What brands/models
|of printers should I look at. What about the Atari laser printer ?
|Any good ? Price ?

I don't know about the Atari laser printer... I have been using a Panasonic KXP1124 24-pin dot matrix printer and it is a tremendous printer for the price (ca. $300)... it has a ton of built-in fonts and excellent print quality. However... I will ultimately upgrade to an HP DeskJet when $$$ are available!

|Also, if anyone has suggestions on good word processing software I would
|appreciate it.

I use FirstWord Plus. The main reason I use it is because it will use the built fonts of my printer. There are (much) neater WP's available but they use GDOS (or other) fonts, not the printer's built-in fonts. Thus, every page is printed as a bitmap. This is just too slow for words on a dot matrix printer. (IMHO - My opinion!). A laser printer (or the afore-mentioned DeskJet) is very desirable if you want to use a GDOS-based WP.

Actually, First Word Plus isn't so bad, it's just not very whizzy. But it is easy and intuitive to use. Fine for letters, which is my big use.

Disclaimer: The opinions expressed herein are those solely
of the author, who has no pecuniary interest in the companies mentioned,
except for HP...

Here's a stupid little question that I need some help with. When I turned my 1040st on the red light was half on and the machine made a high pitched sound. I took it to the local repair place and they said it was probably a blown mother board but they couldn't fix it (they just fix IBMs). I sent my machine to an authorized service place, and I'm still waiting for the verdict. Anyways, does anyone know roughly how much it would cost if it is a blown mother board? If so, is my machine totalled??? (gasp) Also, a while ago it was crashing a lot (frequent and unexplainable bombs), I took it to a repair place and they tightened the chips or something. Could that have been an early sign of my current problem (the blown mother board). Help me pleeeze.

>The problem Greg is that you just plain and simply can't count on
>Atari for support!! If Atari was going to support the ST, why didn't Atari
>license GPLUS from Charles Johnson and include it in TOS 1.4??

You still don't get it, do you? Atari is not in the third-party software business. If a third-party product exists, and you like it better, then buy it, use it, and support the third-party developers! Does it matter if you buy GDOS from Atari or buy it from Codehead? You'll pay for it one way or another! "There ain't no such thing as a free lunch". Also, Ken B. from Atari has repeatedly stated that there isn't room in the ROMs for all of these enhancements! If you like NeoDesk, then buy NeoDesk! If you like GPLUS, then buy GPLUS! Just don't expect Atari to buy your software for you and code it into the ROMS!

>And Atari didn't even want to admit that there was a bug in the serial
>port code in TOS 1.4 until the Canadian hacker showed Atari the actual
>bug in the code. Pretty responsive of Atari, huh?? And this is for an OS
>that has been under development for 2 years!! After 2 years, you would think
>that Atari would have it right!!!

Oh my, a bug in RTS/CTS handling! Tsk, tsk. Forget about the zillions of bugs they fixed, forget about the months of development, and focus on one obscure bug. The reason it wasn't fixed, I'm sure, is that none of the developers who beta-tested even *use* RTS/CTS flow control!

Why don't you pay up and become a developer? Try working to make the Atari better instead of complaining about how bad it is?!?

Go buy an Amiga or something and quit complaining!

>Boy, a good outline font system, aka the macintosh system, would really be
>great for the ST!! But asking Atari for anything like that is like jumping
>to the moon, you'll never get there!!

Better yet, go buy a Macintosh, if they're so great! I think you'll find that Apple can afford the huge R&D costs for new fonts with all the money they make off of the Mac! (Warning: there is probably a generalization there somewhere :-)

Yes, an outline font would be nice. So make one!

>I like the third party support starting to appear for the ST. My favorite
>product is the Turbo16 product from FAST TECHNOLOGY. T16 really speeds up
>my Mega ST!! It is great!!!

I agree. Hurray for the third-party support! Think about it--how much of what's really useful on the IBM-PC is produced *by* IBM? Any of it?

>So, lets support the good 3rd party enhancments to the ST and hope that
>things will get better IN SPITE OF ATARI!!

Wrong. If it wasn't for Atari, we wouldn't have this wonderful machine that truley delivers "power without the price"! When the ST first came out, an 8MHz 68000 was *power*!!! Even today, it is a respectable machine. Ever priced a 25MHz 68030 machine? Come up with a figure a home hobbyist could afford? I didn't think so.

>Rich (Proud owner of a souped up T16ed Mega ST4!!) Covert

You don't sound very proud to me. I'm not trying to single you out specifically, but I sure get tired of people who think that Atari should do everthing for them. I'm glad there are developers who *do* something to improve the machine, instead of just whine and complain.

Well, that's interesting, but only just. Opening the same file
twice is something which GEMDOS doesn't handle well (pun intended).

I can apologize for only so long for how bad GEMDOS is before the
blame shifts from the guy who wrote it (for introducing the bugs) to me
(for not fixing them). I hope I haven't gotten to that point yet.

1690. Hey Borland, why no Turbo C for US?

Newsgroup: comp.sys.atari.st
Date: 1989-10-17 01:36:19 UTC
From: drc@beach.cis.ufl.edu
Message-ID: <21065@uflorida.cis.ufl.EDU>
Source record: 248262

Please excuse my rhetorical device; I know as well as you that
Borland will not respond... I am curious, though, to know
why Turbo C for the ST is not distributed in the US. The only
thing that pops to mind is that the documentation may not be in
English (is it?), and the cost of translation, publication, etc.
makes US distribution impossible. Any ideas?

Why are no enterprising Europeans reselling Turbo ST to the US?
For any kind of fair price, I would buy.

A parting observation: refusing to sell Turbo C in the US seems
very likely to result in (eventual) widespread piracy of the
program in the US. An odd strategy, but I must be missing something...

My ST has to make room for a work PC.

Everything listed below works fine, is in good condition and has
the original manuals and disks.
Prices are listed (or best offer). I'll pay UPS shipping.

HARDWARE:

Atari 520ST CPU/Keyboard, upgraded to 1 Meg, mouse, $ 200
power supply, Timesaver clock,
Original Atari BASIC, Original Atari LOGO
Atari SF354 3 1/2" SSDD diskette drive w/power supply 40
Atari SC1224 color monitor 200
Atari SM124 monochrome monitor 100
Supra 20MB hard disk drive (noisy, works fine) 80
Supra Hard Disk Driver and Utilities

Epson FX85 (rarely used) 200

SOFTWARE/BOOK: (buy 2 & take 10% off, buy 3 and take 20% off)

Beckmeyer C-Shell, C-Tools, C-Make 10
D.E.G.A.S. Elite (nice paint software) 8
CAD 3D 1.x (early version, 3D CAD renderings) 8
PC-Intercomm (VT100 emulator) 10
Isgur Portfolio 15
Word Writer ST 8
Phasar 2.32 15
Perfect Patch by Aegix (nice DX editor/librarian) 15
Generic First Cad 8
Megamax C (early version, good to learn with, heavy docs) 15
Copy II ST 8
Antic Disk Doctor 8
Marble Madness (great fun, 2 player mode) 8
Flight Simulator (still in shrink wrap) 10
Midi Maze (3d maze game, can network via midi) 8
The Black Cauldron (good game for 8+ year old) 8
Donald Duck's Playground (good game for 6+ year old) 8
Star Glider 8
Star Raiders 8
The Pawn (nice graphics) 8
Sundog (good space adventure) 8
Balance of Power 10

1696. Re: Event multi

Newsgroup: comp.sys.atari.st
Date: 1989-10-17 04:55:03 UTC
From: esp_05@jhunix.HCF.JHU.EDU
Message-ID: <2962@jhunix.HCF.JHU.EDU>
Source record: 248268

I have had success testing EITHER mouse key with evnt_multi, but it's not a pretty method, and if you use it in conjunction with drop-down menus it can do wierd things. I used two calls to evnt_multi in a loop, one checking for one mouse button, the other for the other, while throwing in a timer event set at around half a millisecond (if I remember correctly). If evnt_multi with one button (and whatever else) returns a timer event I run it with the other button, in a loop, until I get something other than a timer event. THe problem is, if you set the timer event too quickly the menu bar does wierd things, or doesn't work at all. So if you really want to use evnt_multi, you have to do what is the operative phrase with Atari--

DEAL WITH IT.

Ciao... Eric

1697. GDOS with outline fonts?

Newsgroup: comp.sys.atari.st
Date: 1989-10-17 05:15:18 UTC
From: stephen@oahu.cs.ucla.edu
Message-ID: <28181@shemp.CS.UCLA.EDU>
Source record: 248269

Has anyone heard news about the mythical GDOS + driver upgrade that will support outline fonts? If Atari isn't going to do it, maybe someone else will. Atari might even license it. Outline fonts for GDOS would mean that you could use one set of fonts for all screens and printers in any size desired. I would think that anyone who currently makes a GDOS program would be extremely interested in seeing this happen. The new screen driver to support outline fonts might even be optimized to make auto-folder patches unnecessary to improve VDI drawing speed.

Comments anyone?

1698. FTL news flash!

Newsgroup: comp.sys.atari.st
Date: 1989-10-17 05:17:04 UTC
From: paul@cacilj.UUCP
Message-ID: <1267@cacilj.UUCP>
Source record: 248270

I just got back from the local S.D.A.C.E meeting where our featured guest was Russ Boelhauf (marketing whiz) from FTL. He had many interesting things to say about Chaos Strikes Back (the official title of the long-awaited "sequel" to Dungeon Master):

o This is a stand-alone game. Despite what the box says, it does not require Dungeon Master at all. This decision was reached after the artwork went out for the box.

o There are around 13 NEW MONSTERS! The playtesters were unanimous: more monsters!!! So they had to move away from the "expansion set" approach they had been following, and move to a stand-alone game.

o No news on spells. No one asked, and he didn't volunteer. Sorry!

o Shipping between November 6 and November 15!!! (Yes, that's this year :-) Suggested retail $39.95. Just like DM.

o Chaos is not a sequential games as was DM. You can apparently wander around and solve the various "predicaments" piece by piece. So you can concentrate on one part of the dungeon and then go back later and work on another part.

Some of the goodies in Chaos Strikes Back are:

o A character editor. Now you can draw or edit your characters just the way you like! Included are artistic renditions of the way your favorite characters would look after years of adventuring. (Russ's favorite addition was a pair of sunglasses to protect from that fireball glare :-) You can save your artwork, and trade with your friends!

o You can use old characters off of a Dungeon Master save disk, or build a new party out of characters they provide. You should have made it through at least half of Dungeon Master for your characters to survive more than 30 seconds :-) They will enter the world naked! (No firestaff or armor :-)

o A hint "oracle". You insert your saved disk, and get context-sensitive help. That way there are no "spoilers".

o For completeness, I will mention the animated "cartoon" sequence you can optionally view.

o Some really mean situations. Russ normally gets blown away in about sixty seconds! You enter the dungeon "naked and with your pants down" as Russ says :-) (How can you have pants if you're naked? :-) He says the monsters are *mean*! When you open the door, you'd

better be ready!

Some neat points, ideas, etc.:

o The copy protection on Dungeon Master has been patented! They are "thinking" about having some means of individually registering a copy and at the same time, removing the copy protection. The idea is that if they see pirated copies, they will know where it came from.

o Other ideas for other games from FTL include a sci-fi adventure, a Stephen King style horror, and a haunted house, all first person-style adventures a la DM. Don't hold your breath! These are just "ideas"!

o He felt that he experienced less piracy on the ST than any other machine. Gillman Louie take note!

o 2/3 of the total sales of DM were in Europe, which he considers to be a much more "boom and bust" market. Most of the european sales were in a very short period of time immediately after announcement.

Note: Russ gave us permission to post whatever he said on GEnie, etc. Thanks to FTL for giving us the info we've been waiting for! Thanks to our club newsletter editor for the coup!

I can always hack around the operating system. I find that I almost always have to hack around GEM for any non-trivial program. But I'm truly amazed that GEM can't even handle selecting the left button OR the right button.

Because of this I'm always tempted to circumvent GEM completely. Which defeats the purpose of having something like GEM.

Enough said,
Eric

Atari: I understand that it's not your fault that GEM is drain-bamaged and can't detect _EITHER_ the right button _OR_ the left button in the same evnt_multi call, but I have never yet seen a program which uses evnt_multi to detect both buttons at the same time (Interlink uses this, but I'm sure they've hacked their own VDI mouse handler or something.

How about _CHANGING_ evnt_multi so that if it sees a 3 in the button mask, it returns if either button or both buttons are pressed. Then the application can check to see which it got. Sound okay? At least do this for TOS 1.6 so that TT software can use both buttons effectively without hacks! Pretty please!!!

(While you're at it, the TT could probably do with a few more windows for that nifty 1280x960 mode too.)

Just to be positive, I have Rainbow TOS, and I _LOVE_ it!!! Wouldn't go back for anything. Fine job!

bob> but... that seems to me to be an awfully limited usefulness..
bob>
bob> If you DON'T have an IBM PC style system, a Portfolio is an expensive toy...

I disagree. I was very, very interested in purchasing a Portfolio
until I saw the cost of the accessories needed to make it a useful
machine. I don't own a PC; I own an Amiga 1000.

The Portfolio can serve as an "on-the-go" text editor for editing
correspondence and even reading netnews (one of my intended uses). It
can transfer files to non-IBM machines via the serial port.

Unfortunately, the cost of a Portfolio with one 128K memory card and
the serial port extension is $680. A Toshiba T1000 with a full-size
screen, 512K memory and one 720K floppy drive is $600 street price.
The Portfolio is smaller, but the T1000 is still acceptably small and
much more functional.

>we only have choices between Mark W. C and Laser C.

OK, you have to buy the stuff directly from the European vendor.
If enough people in the US try to buy the compiler, the guys at Borland
will change their minds (eventually).

I just got an add from a German magazine called "ST Magazin" from September
1989. It says that a company called Borland GmbH in Germany (they changed
their name is suppose) is selling the package for some 228 DM. ($100)
The developers version including an assembler and symbolic debugger
costs 342 DM. ($160).

The address of this company is:
BORLAND GmbH
Lindwurmstrasse 88
D-8000 Muenchen 2
Telex 5212637 mcm d
Telefax (089) 779339
Tel. (089) 72010-201/202
All this is in West-Germany.
Remember that these numbers are only valid from within W-Germany.
I think that you have to leave the initial 0 (of 089) away when you call
from any other country than W-Germany.

What is the newest version of QuickSt. I have 1.2 and it works
quite well but not with WordUp 2.0. I know that I should disable
fast draw, but WordUp is so FAST for a while (before it crashes).
Newest is propably shareware no more ???

So does the newest version live along WordUp (hope, hope..) ?
Does it use blitter ?

Thanks !

The following E-mail message arrived this a.m. As a background, it is from a PC user who flamed the Portfolio (I mean incinerated it) when I first announced it on our company's BBS. As you will read, having seen and used one has changed his opinion somewhat!

==========

Greg:

Would certainly oblige if I'm around: for your interest, we have ordered FOUR units, a parallel interface and one memory pack for our branch -- works out that four people now have portable PC ability for about 1/3 the price of a laptop and goodness knows how much saving in space!

Croombe

PS That's FOUR units for 1/3 the price of ONE laptop!

PPS I like the little unit: so does everyone else to whom I've shown it -- Thang Le (who's in our branch 1/2 time) brought one over yesterday so I was showing it off to PC users and got the enthusiasm I expected! There are some dandy features packed into that litle case -- if it was'n't for budgetary restraints at home right now, I'd buy one for myself!

>With graf_mkstate you can *sample* the state of the mouse buttons. But the
>question is, how to wait with event_multi on either mouse button. I did not
>solve the problem and I'm waiting too for contributions.

I haven't tried this, but one idea I had/have to solve this problem,
is to
(1) Substitute the normal mouse button handling function by a
function CheckButton() by using vex_button (I don't know the
name of the VDI - function which exchanges the mouse button
function, but there is one!)

(2) Write a new evnt_multi() function called, e.g., event_multi()
that checks if the right mouse button is to be waited for. If
that's the case it sets a global flag (i.e. one which can be
accessed by CheckButton()!) and calls the normal evnt_multi()
function telling it to wait for the *left* button *only*
(only because that worked always, waiting for the left button
only, I mean).

Now - whenever a mouse button is pressed CheckButton() will be called
with the state of the mouse buttons in register d0. CheckButton looks
at the global flag mentioned in (2), and whence it's set, it checks
wether the right mouse button has been pressed. If the the right mouse
button *has* been pressed clear the corresponding bit, set the bit for
the left button (on which we're waiting), set a global flag to signal,
that the right button has been pressed and call the *old* mouse button
interrupt handling function (which address we have stored in a global
variable, too).

Now the operating system and finally AES get informed that the left
button has been pressed (which we faked just previously ... ;-)), which
results in evnt_multi() returning to our event_multi() function. All
we have to do is to check our global flag to see wether it's an original
left button result or wether it's been the right button which was
pressed. This we return to the calling process (program).

How about that idea? I haven't tried it yet, but it seems workable. In
Sozobon C you can use the asm() operand to move the content of register d0 to
a register of the function CheckButton() and back again to d0 before calling
the old mouse button interrupt handling function.

Has anybody tried this already? Is there something I missed? Comments!

The actual price is 279.- DM ($ 146) including Debugger/Assembler.
Among other very good features there is the possibility to direct the
compiler to accept ANSI-C only. I highly recommend TURBO C too.

If the question referred to the software end of things, the "print screen" desktop function (ALT-HELP, isn't it?) assumes an Epson-compatible. Does anyone know if there's a "sanctioned" way to make the ST assume otherwise? Did the foolish Atari printer-control accessory (which didn't stay on my boot-disk long) allow this? I seem to recall it had options for something along those lines...

(I have an Epson-compatible; I'm just curious...)

>developers who beta-tested even *use* RTS/CTS flow control!

Folks, what we have here is the bane of the consumer -- the "brand loyalist."
By that I mean those of us who've used Ataris and (yes) Commodores since long
before the IBM PC was a twinkle in Big Blue's eye. I'll bet that he (like a
lot of us) stuck by his small, innovative company from Atari 400/800 through
1040ST, with all the lean years in between.

Maybe some of you remember (or HAVE) the Commodore 64 and 1541 disk drive.
For years Commodore denied that its DOS had any bugs despite frequent testi-
mony about its file overwrite (save-with-replace, they called it) doing all
kinds of strange things from swapping filenames to triggering nuclear melt-
downs. Well, somebody finally PROVED that the bug existed, Commodore was
forced to at least acknowledge it (and recognize that others might exist) and
the users of Commodore computers were safer and happier.

My point here is that a bug -- any bug -- is an IMPORTANT THING. Allowing a
company to sell buggy software is tantamount to letting it screw you in any
other way. Don't let Atari off the hook on this one so easily. You might
regret it later, and so might they (big business doesn't deal with companies
that turn a blind eye toward product shortcomings -- denying a bug is not the
way to generate confidence in a small, undermarketed company like Atari).

>Why don't you pay up and become a developer? Try working to make the Atari
>better instead of complaining about how bad it is?!?

It's ATARI's job to make its products work correctly, not its users'.

>Go buy an Amiga or something and quit complaining!

"My Atari -- love it or leave it," eh? Well then next time you're screwed you
will know who to blame: yourself. (BTW, all my comments apply equally to
Commodore -- and any other company, for that matter.)

>Wrong. If it wasn't for Atari, we wouldn't have this wonderful machine that
>truley delivers "power without the price"! When the ST first came out, an
>8MHz 68000 was *power*!!! Even today, it is a respectable machine. Ever
>priced a 25MHz 68030 machine? Come up with a figure a home hobbyist could
>afford? I didn't think so.

Just a note: anybody remember the original price of an Atari 800 with 16K? I
seem to remember a figure around $1000 or so.

>You don't sound very proud to me.

He doesn't have to be proud of Atari (the company) to be proud of Atari (the machine).

>...I sure get tired of people who think that Atari should do
>everthing for them. I'm glad there are developers who *do* something to
>improve the machine, instead of just whine and complain.

When buying a computer, just as for any other high-ticket item, you're buying the company behind it. If service is nonexistent, if support is minimal, if the company is unresponsive, then the computer, no matter how technically advanced, will never gain acceptance -- especially companies like Atari and Commodore who already have negative images.

FOR SALE: Atari 1040ST with color monitor and software:

Software includes:
PageStream (most recent upgrade) - desktop publishing.

Megamax Laser C - C language development system.

Degas Elite - raster oriented paint program.

Jet - Jet Aircraft flight simulator.

PC Ditto - Very good MS/DOS emulator. Runs
Lotus 123, Procomm, QSB & a bunch of other
major MS/DOS programs.

Assorted other softare including a spreadsheet,
word processor & spell checker and games. This
also includes some public domain MS/DOS software
as well.

I have all the original hardware manuals & other assorted documentation that
came with the system when I bought it.

Price = $750.00 for everything.

/Line Eaters 'R Us/

All about advertising - if you don't care, skip it now...

In article <4669@udccvax1.acs.udel.EDU> don@vax1.acs.udel.EDU (Donald R Lloyd) writes:
>The Amiga ads were on Fox? They were supposed to be on all the networks,
>and the big "Kickoff" of them was supposed to be during last night's football
>game. I taped it & fast-forwarded through the whole thing... not one amiga
>commercial.
...in some areas, yes. The commercials weren't network-feed, they were
handed to the local stations. Some local stations didn't run them (like the
local ABC affiliate) which is legal/acceptable/all that.
Yesterday as a whole was the start of the CBM/Amiga ad campaign, from
what I understand.
> And they were supposed to start printed ads in Time, Newsweek, and Life,
>but the new issue of Time is out, and no Amiga. So far, it's not much of
>a media "blitz."
From what I understood, the print ads in Time and etc aren't supposed
to start yet. (In fact, I don't know what the exact start date is.) The TV
ads will be for the A500; the print ads, as I understand it, will be for
the A2000 and A2500 in professional settings. The Time/Newsweek/Life(?) ads
are supposed to be seven-page series ads.
The goal, again as I understand it (I do not now and have never worked
for CBM) is to have 95-98% of the US to have seen at least two Amiga commercials
by the end of the year. To this end, CBM will be spending some $14 million in
advertising, putting it into the list of "Top 80" advertisers, ahead of both
IBM and Apple for the quarter.
BTW, for those interested; I'm the person who talked about the Atari ST
emulator for the Amiga before. I still have not found a working copy. As I
stated in an earlier post (to c.s.a), I am still working on finding out whether
this thing actually exists in viable form. Both copies I have had have
arrived "damaged;" specifically, the writers of the emulator used "hidden"
files (_not!_ part of the operating system) which were apparently partially
destroyed in transit from the point of origination in Austrailia.

Internationalization of Computer Software (CALENDARS)

A couple of months I started a discussion on the "internationalization" of software. I received numerous excellent suggestions about paper sizes, time and date formats, format of floating point numbers (and the radix character), and some machine-specific tips (support full 8 bit character sets, etc.)

I have another question, about calendars: which day should be in the leftmost column? Is Sunday always in the leftmost column everywhere? Is Sunday always in the leftmost column in the USA? If the answer is no - which other day(s) should be in the leftmost column: Monday? Just Monday?

Thanks in advance,

Eric Terrell

1728. The elusive PC-DITTO II

Anyone considering purchasing PC-DITTO II might want to consider otherwise.
First, the coupons for registered users, were mailed very late.
Once receiving the coupon, one could see how unexpectedly late they really
were (by noticing the deadline for use of the coupon was already past). They
extended the deadline, and said allow 4-6 weeks for delivery.
I ordered mine 5 weeks ago, and know of others who have ordered theirs about
7 weeks ago.
First I was told by Avant-Garde that they will begin shipping them by the first
of this month.
I have been calling Avant-Garde every few days, (including today), and every
time I get through now, I am told that they will be shipping "sometime" this
month. I don't expect to see a pc-ditto II before the end of this semester.
By the way, all orders had to be accompanied by a money order... So they are
all already paid for...

They (at Avant-Garde) say they are in the "production" stage.

If I were to recieve a pc-ditto II, I would cease to be upset (unless it did
not work properly), and post messages telling everyone how wonderful they are.

But I don't see that happening anytime this year... (no less this "month")...

AAron "Ya, I'm upset" nAAs
disclaimer: I don't care if anyone thinks the way I do, it's their
fault if they do...

US Robotics has had an outstanding offer to BBS Sysops, and also to USENET
Node Adminstrators. In brief you can buy an USR 9600 HST modem for the low
price of $495.00. This has made the USR 9600 HST very popular with ST BBS
sysops. The the majority of ST BBSes which use a 9600 baud modem use the
USR 9600 HST. So, just call around and look for ST BBSes which are 9600
buad and you can talk to lots of folks!!

>
> I am currently getting about ~1625 cps in HST mode. Protocal used is Zmodem

Your transmission speed depends greatly on the quality of the phone line, but
1625 cps sounds typical for that modem. You won't get that high on some
boards though. Some of the loss can be attributed to the TOS, it just can't
handle data that quickly off of the serial port.

>
> Also, is there terminal software out there which supports Ymodem-G? I

That is typical also for Y-modem transfers. The only program that I know of that
gets >>800 cps for uploads is ST TERM, with its built in Z-modem protocol.

I have had my USR 9600 HST for 6 months and have found that it is very reliable,
and has paid back it costs via lower phone bills already!! And USR has sent me
to updates (firmware) to it already for free!! That's good support!!

1731. Laser C 2.0 Interim fix for TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1989-10-17 21:43:58 UTC
From: SML108@PSUVM.BITNET
Message-ID: <89290.174358SML108@PSUVM.BITNET>
Source record: 248153

I have been told that there are five values that one can change in Laser C 2.0 to make it work with TOS 1.4. Does anyone know what these are ? I am awaiting my upgrade but God only knows how long it will take Megamax to get it to me.

Scott

>
> Matthew Seitz

I think there really is somthing to the PC DITTO/TOS 1.4 incompatibility.
-- and I just thought I was having problems with cosmic dust.

I have two systems a 2.5 meg 1040 and a 1 meg 520. The 1040 with BMS-x00
will bring up PC DITTO from hard disk. THe 520 has a SH204, with the same
files and order. PC DITTO refuses to boot fro the HD, only a Floppy.
Once up, it reads the HD just fine.

Maybe there really is a problem.

>Flash 1.60 137.492 K 106.222 K 97.220 K
>WordPerfect (Aug 89) 204.280 K 161.726 K 151.632 K

Ok, let's assume wordperfect is a pretty average binary file. If anyone knows otherwise, please fill me (and the net) in. I observe from the numbers given that it compresses (1 - (151632 / 204280)) % or about 26%. The other examples range from ~ 29% to 56%. I am suspicious of the 55% value, but what the hay. I say this because I notice that as the files get bigger, performance drops off. This is counter-intuitive, to say the least...

Anyway, I just tried compressing GNU emacs - original 991232 bytes, compressed image 492357 bytes. Compression = (1 - (492357 / 991232)) %, or about 51%. This was done with the freeware version of 16-bit LZW compress (the same compress that comes as part of GNU) running on my 1040. I think emacs is as typical a binary as exists. (What that says about me is left as an excercise for the reader ;-).

Or /usr/local/bin/vnews, ~200K, compresses about 39% (this is done on a BSD box that's handy, but its exactly the same code on both machines). Both of these binaries are 'pretty average', I'd say. Big, but average. Notice big files work better, not worse.

Now compress is unfriendly, and cryptic, and free, and it's been around a long time, and everybody has one on their crufty old unix box, and the DOS guys have a version, and we ST guys have a version, and the minix-ST people have a version, and they all interoperate, and you can get the source code for free from damn near anybody. I can speak personally for the unix, st, and minix people, since I'm one of each. And I have one of each :-).

Whereas DC Squish works I-know-not-how (and it clearly changes with the phase of the moon), and if they've got DOS or unix or minix versions you don't mention it, and I expect the source is proprietary as all heck, and they sell binaries for money. That's private enterprise, which I support. Wholeheartedly.

But from your numbers, compress easily matches DC-squish on performance, and creams it on almost every other metric I can think of

(except user interface: honestly, compress doesn't have one). Us
old-timers, we're hard to impress. BTW, there are some clever
techniques out there - fractional huffman encoding comes to mind -
that can beat Lempel-Ziv-Walsh encoding (the "LZW" above).

Sorry to rain on your parade, but "Just the facts, ma'am, just the facts".

Ross

ps: anyone want a copy of compress? I'm suprised it hasn't come by
again on comp.binaries.atari.st - the program is _small_, about 32k.
Steven Grimm, you out there ?

>Folks, what we have here is the bane of the consumer -- the "brand loyalist."

Not fair. I understand Paul - he's tired of someone who never stops whining, just like I am. Oh, Richard Covert's knock on the RTS/CTS bug is not too negative, but he *did* make the comment that Atari should have gone back and re-done the PROMs. To do so would be truly stupid.

My point (and as I read it, Paul's point) is that for a small bug like RTS/CTS, you don't stop delivery and start a new distribution. Doing that would do a great disservice to the people who want and need the majority of the fixes you already have. It is truly unfortunate that the bug wasn't found by alpha testing at Atari, but them's the breaks. It's maybe not good at all that they didn't acknowledge the bug right away. But you don't stop everything when you've almost got stuff that people have been waiting for for two years or more ready to come out of a three month pipeline. You have to leave some stuff for the next release sometimes.

I want those ROMs, and I can work around the RTS/CTS stuff, I suspect. What I don't wish to do is wait three more months for a different set of ROMs that fixes one more bug, because the odds are 99.5% that more bugs will be found in the interim, and we'll be right back again. If more bugs are found in the next few months, I *would* like to hear at that time that another release is planned.

1735. Re: Hey Borland, why no Turbo C for US?

Newsgroup: comp.sys.atari.st
Date: 1989-10-18 04:32:35 UTC
From: limonce@pilot.njin.net
Message-ID: <Oct.18.00.32.35.1989.28642@pilot.njin.net>
Source record: 248157

Maybe because there isn't a "real" Turbo C for the ST?

That takes some explaining.

When Borland ported Turbo Pascal to the Mac, they did a real port, hired 680x0 experts, etc. This "Turbo C for the ST" is a third-party that made a C compiler for the ST and is having it marketed by Borland in certain countries. I'm sure this third-party has put a lot of effort into making it compatible with the MS-DOS "real" Turbo C.

Now, the eighth-hand information that I've gotten (NOTE: DISCLAIMER: THIS ISN'T FIRST HAND INFORMATION) is that this third-party ST product is second rate... or at least it doesn't meet "American standards".

If this is true, I'd understand why Borland wouldn't want to get embarrassed by shipping it here. (I am, obviously, writing this from the states). Then again, maybe they just don't have the (VERY BIG) staff required to properly support a product. Then again, maybe they're shooting for a different image than the ST can provide. Then again, maybe I should stop conjecturing and post this.

1736. Re: official tos 1.4 release

Newsgroup: comp.sys.atari.st
Date: 1989-10-18 06:04:56 UTC
From: dnewton@carroll1.UUCP
Message-ID: <756@carroll1.UUCP>
Source record: 248158

In article <1266@cacilj.UUCP> paul@cacilj.UUCP (Paul Close) writes:
>Just don't expect Atari to buy your software for you and code it
>into the ROMS!

I don't think we're asking Atari to buy third-party software and
burn it--we are asking them for a real _WORKING_ environment. i.e. a
move routine would have been nice, and has now been implemented. But why
wasn't it in the first place? RTS/CTS bug? Some people might need that.
Why release comm warez that are buggy?

>Oh my, a bug in RTS/CTS handling! Tsk, tsk. Forget about the zillions of
>bugs they fixed, forget about the months of development, and focus on one
>obscure bug. The reason it wasn't fixed, I'm sure, is that none of the
>developers who beta-tested even *use* RTS/CTS flow control!

Doesn't really matter, does it? ATARI sells it, Atari better make sure
that it works. Something as significant as this should be caught in
alpha. As for the months of development, that goes into any software package
meant for general consumption.

>Why don't you pay up and become a developer? Try working to make the Atari
>better instead of complaining about how bad it is?!?

Yeah, I'm sure everyone that finds a bug is a competent enough programmer
to develop their own OS patches. Get real.

>Go buy an Amiga or something and quit complaining!

Ugh. I'd sooner eat camel spit.

>>Boy, a good outline font system, aka the macintosh system, would really be
>>great for the ST!! But asking Atari for anything like that is like jumping
>>to the moon, you'll never get there!!
>Better yet, go buy a Macintosh, if they're so great! I think you'll find that
>Apple can afford the huge R&D costs for new fonts with all the money they make
>off of the Mac! (Warning: there is probably a generalization there
>somewhere :-)

How hard would it have been? They made a choice (I think the wrong one)
and now we have to make up for it with 3rd party. Besides, I hardly think
that Apple spent the huge quantities of money for "font development" that
you allude to. Most fonts are PD anyway.

>Yes, an outline font would be nice. So make one!

If it would be so nice, why don't you make one?

>I agree. Hurray for the third-party support! Think about it--how much of
>what's really useful on the IBM-PC is produced *by* IBM? Any of it?

Fortunately no. Whew 8-)

>Wrong. If it wasn't for Atari, we wouldn't have this wonderful machine that
>truley delivers "power without the price"! When the ST first came out, an
>8MHz 68000 was *power*!!! Even today, it is a respectable machine. Ever

Well, I don't know about that. I'd almost be certain that someone would
have come up with a machine with similar capabilities. IBM hasn't _totally_
destroyed people's creativity yet.

>ever priced a 25MHz 68030 machine? Come up with a figure a home hobbyist could
>afford? I didn't think so.

This is quite irrelevant, as the ST isn't a 68030 machine, nor do they
have one shipping yet. What I would suggest is a comparative study of
68000 machine, 80286 machines, and NS32016 machines. I think you'd find
there are some very interesting machines in these classes that would lay
waste to the Atari at around the same price. _And_ are expandable.

>>Rich (Proud owner of a souped up T16ed Mega ST4!!) Covert
>You don't sound very proud to me. I'm not trying to single you out

Being proud does not mean unlimited support. Indeed no, it means being
tough on whatever it is, so you can make it even _better_.

>PC Ditto v3.01 will NOT work with TOS 1.4. I forget what the error
>says, but I think it was something like: "Does not work with this
>version of TOS" or something to that effect. Too bad there isn't a way
>to piggy back the two versions of ROMs and have a hardware switch
>between them.

No? Well, the first solution it is easy, if You have a machine with TOS in 6 ROMs.

These are xx256 JEDEC-pinout-compatible mask ROMs. So 27256 EPROMS are possible replacements.

And so are 27512. Pin 1 of the 27256 is called Vpp (programming voltage) and is to be held at +5Volts when the ROM is simply used (not programmed).
Pin 1 of the 27512 EPROMs is the necessary additional adress line.

So, get Your EPROM programmer, read in each of Your original ROMs (all twelve of them), get 12 sockets (28 pin, 600 mil EPROM sockets), a 10 kOhms resistor, a siple litte switch, some isolated wire and 6 27512 (or C512) EPROMs.

Remove pin 1 of 6 of Your sockets; this is done to isolate EPROM pin 1 from the ST circurit board. Plug in the remaining 6 sockets. See how pin 1 has lost contact to the +5Volts line. Connect all pin 1 with some wire.

Now connect the 1 kOhms resistor to pin 1 and pin 28 of one of the upper sockets. Pin 28 is the +5Volts (Vcc) power source for the ROMs.
Connect the wire to the switch and the switch to ground (pin 14 of the ROMs is ground, for example).

Now the switch switches the most significant adress line for the 512-EPROMs between ground (low) and open (10-k pullup to Vcc; high). So the switch selects "upper half" or "lower half" of the EPROM.

Burn a set of EPROMS with TOS 1.2 (or 1.0) in one half and Rainbow TOS in the other.

works fine for me :-)

Second solution: use 6 static RAMs (62256 or Nec42256 and a battery to emulate 6 ROMs.
This was done by some german freak, who published his solution in the german magazine c't. The pcb is availeble, as are the required PAL chips. This even adds a Mega-ST-compatible clock to non-Megas...

I'm still trying to find some time to get it to work... :-(

I just got my ST so I'm a real novice, and this may seem like a really naive question but here goes: Is your program set up to use or try to use the hard disk at all? When your program was first installed was the hard drive on? At installation time is it possible that the program in question put a file on the harddisk that he needs to see to initialize and run?
Just groping.

Deskjet SOFT fonts

Does anyone know the defenition of the soft font format
used by the deskjet printer. I recently bought a 128K RAM
module for my printer and want to use the downloadable softfonts.

HP has got download software but that's only aviable for MS DOS.
I want to write my own softfont utilities on my ATARI. (e.g. Font
editor, and download package.) Neither the Deskjet user manual
nor the documentation of the 128 K RAM module gives any information
on the format of the fonts. I assume there is very much similarity
with the LASERJET Font format, so with a little conversion the laser
jet fonts should be usable with the deskjet.

Another question concerning Deskjet fonts : HPJOURNAL states that the
fonts in the deskjet printer are defined on a grid of 1/600". Is this
also appliciable on SOFT fonts. If so, it has to be possible to write
software that lets the printer print with a resolution of 1/600", using
softfonts !

Hope anyone could provide this information.

From: achowe@tiger.waterloo.edu
Message-ID: <17337@watdragon.waterloo.edu>
Source record: 248168

About 2 years ago this question came up on the net. I still have a hard copy
of the post which I used to develop the following tit-bit on detecting the
right mouse button. Anyways it boiled down to this...

"Install your own button handler in assembler. The button value comes in
d0, save it out to a nice place, then change it to a left click no matter
what, and install the routine using vex_butv()." - Kenneth Soohoo

Long exmaple to follow......

```
--------->8------- EXAMPLE ------------>8--------------
;***
;*** Button Handler
;***
;
; Trap the mouse button state because the current handler kills or ignores
; the right mouse button. Once the state is stored chain to the old handler.

.bss
.globl _OldButHandler
.comm _OldButHandler, 4
.globl _ButState
.comm _ButState, 2
.text
.globl _NewButHandler
_NewButHandler:
tst.w d0
beq.s newbut1
move.w d0, _ButState
move.w #1, d0
newbut1:
move.l _OldButHandler, -(sp)
rts

;*** end of Button Handler

-------------->8--------- C portion ------------>8----------
/*
This example code is ripped straight out of a game I'm writing. There
is more here than necessary. But for the curious here is a good
portion of setting up a GEM application. The routines to look at
in connection with button events are: init() - right at the end,
fini() - near the top, and ChkButton() - first line. In ChkButton()
I could have tested ButState directly but then I would have had to
change M.bstate everywhere. Some code has been ripped out that is
relative only to the game itself (not GEM or buttons). Also all the
```

```
global variables have been left out too. I denote globals variables
and routines with a capital letter at the start of a name and on
and clear sub words -- eg ChkButton is global while process is local.
Dummy is global while foobar is not, MenuObj is global while snert_var
is not.

The great book on GEM programming is << Programmer's Guide to GEM >>
by Phillp Balma and William Fitler from Sybex (ISBN 0-89588-297-3).
They howver do not cover the right mouse button problem.

NOTE: This is an example only. This code will not work without further
additions and routines.

>
> Comments anyone?
>
> --Steve Whitney

This brings up one of my pet peeves about Atari, the lousy fonts and GDOS.
And the fact that the VaporWare TT will use the existing GDOS with all of
its warts!! In fact, I haven't even heard that the TT will include GDOS
in the ROMS, which is probably for the best as it allows the user to replace
GDOS with the much better GPLUS from Codehead Software.

There have been rumors for a year or so about a new font system for the ST
which would use outline fonts (ala the Macinstosh and Postscript) but I
don't believe them.

One of the nicest features of the Steve Jobs' NeXT computer is the fact that
it uses Display PostScript to give you BOTH screen and printer Postscript fonts.
Now that would be a good reason to buy the TT, if it came with Display PS.
But, don't hold your breath!!

So, in the meantime, save your peenies and buy a real computer like the
NeXT if you want professional graphics!!

1748. Mega 2 & TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1989-10-18 15:37:41 UTC
From: viljanen@cs.Helsinki.FI
Message-ID: <2706@hydra.Helsinki.FI>
Source record: 248170

Is there a trick to installing TOS 1.4 into Mega 2's?
I know a guy who has installed several ROM sets into all kinds of
ST's (520 ST - Mega 4). But only with Mega 2's he has problems;
only 1 machine worked from the 6 he has done. Other types (even Mega
4's!) have worked OK.

So, who knows what's the crucial difference between Mega 2 and Mega 4
so the same installing procedure doesn't work with Mega 2 but works
with Mega 4?

Any help appreciated.

1751. RAM upgrades for 520ST

Newsgroup: comp.sys.atari.st
Date: 1989-10-18 16:29:51 UTC
From: dmk@cbnewsi.ATT.COM
Message-ID: <956@cbnewsi.ATT.COM>
Source record: 248173

I currently have a standard 520ST that I
would like to upgrade to 2.5 Meg (I already
have the 16 1 Meg chips).

Could someone please summarize the hardware
changes required to convert a stock 520ST to
2.5 Meg? I have build hardware projects before
and would rather do the modifications myself.
Besides, the RAM chips I have are surface mount,
not DIP, so they wont work with any of the RAM
boards that I know of.

Thanks in advance,

dan k.

1752. Re: The elusive PC-DITTO II

Newsgroup: comp.sys.atari.st

opielask@image.soe!clutx.clarkson.edu writes:
>
>Anyone considering purchasing PC-DITTO II might want to consider otherwise.
> [stuff deleted about how late the product is]

Avant Garde is a small operation lacking the $$ and push of much bigger corporations. The lateness of their product is due to them being pushed aside, at the production level, by bigger companies with many $$ who want *their* products fast (now!) and are willing to pay extra for it. Avant Garde doesn't have this kind of pull (push?), so they are hanging in their (complaining and pushing) and trying to speed things along.

A second reason for the lateness is the re-design of a cable to the 68000 so that this upgrade will be *completely solderless*. You might not care about this particular feature, but I (and many others) do care! The 68000 is one heck of a solder job, and the less heat in my machine the better!

>By the way, all orders had to be accompanied by a money order... So they are
>all already paid for...

And all the money is in an escrow/trust account so that Avant Garde CANNOT TOUCH IT! Because it is in such an account, if you DO want your money back you can have it in an instant! They haven't re-invested the money or used it for other purposes -- all the money is ready to be refunded, if necessary.

>If I were to recieve a pc-ditto II, I would cease to be upset (unless it did
>not work properly), and post messages telling everyone how wonderful they are.

Hang in there. Personally I think that this product is going to be worth the wait! It will do for PC emulation what FAST is doing for 16 MHz speed.

Usual disclaimer: I'm not connected with Avant Garde in any way (heck, I don't even own PC Ditto I :-). I just know ``people on the inside'' and that is what they have so say...

>
>Just a thought. Any comments any one ?
>
>! Markku M{enp{{ (jackin) !
Yeah, i've a comment on this.

I don't think that the USSR is an attractive market place for ATARI.
The computers the Soviet Union wants to buy aren't produced by ATARI.
They need mini's and super computers and they do not have the bucks to
buy STs for their schools.
I've been twice in the USSR, i talked to many pupils and visited a couple
of schools, but i didn't meet anyone who had ever worked with a computer
(even not with a pocket-calculator; some friends of mine sold a few of those
solar powered credit card sized calculators, each worth a few bucks.
They got about 60 rubels, that is 90 dollars ! The average salary of a russian
is 150 rubels ...).

I can't imagine that the USSR would by ANY computers for their schools within
the next 5 or 10 years.

pii/West Germany

(Besides, in the GDR, there are quite a lot computer owner and user !)

<sales pitch on>

In article <759@utacs.UTA.FI> jackin@utacs.UTA.FI (Markku M{enp{{) writes:
>
>What is the newest version of QuickSt. I have 1.2 and it works
>quite well but not with WordUp 2.0. I know that I should disable
>fast draw, but WordUp is so FAST for a while (before it crashes).
>Newest is propably shareware no more ???
>
The newest version of Quick ST is 1.6, sort of unofficially released a few weeks ago. It runs from the AUTO folder and automatically installs either color or monochrome code to save memory. It matches or comes pretty darn close to the speed of Turbo ST 1.6, and fixes two known serious bugs that Turbo ST has. Memory usage is about 20K, half of what Turbo ST uses. For 520ST users there is an even smaller version which is just slightly slower.

It will be "official" as soon as we get a proper announcement written up an released to the other online services, so at this point it is still subject to minor changes. The reason it's taking so long is because the new update covers all 8 Quick Utilities, not just Quick ST.

>Newest is propably shareware no more ???
>
Still shareware. The way the numbering scheme works with all of the Quick Utilities (Quick ST is one of 8 utilities that come in the package), is that earlier versions, numbered from 1.0 to 1.49 were released to the public as shareware. People who send in a shareware donation then get mailed the latest versions, which are numbered 1.5 and up.

If you wish to try the last versions released to the public, you should get Quick ST 1.4, which is a desk accessory, or Quick ST 1.45, which is an AUTO folder program. The public versions do not support Atari GDOS, but do work with Codehead's G+PLUS. We even released Quick ST source code, although I'm not sure if any of this stuff is still up on Usenet. It's definately up on Compuserve, GEnie, and BIX.

>So does the newest version live along WordUp (hope, hope..) ?
>Does it use blitter ?
>
By now, it probably does. Remember, the version you're trying is quite out of date. One of the local dealers around here has had Quick ST 1.6 installed on their Mega 4 for several weeks, and had only a few minor problems which are now fixed. The reason there were so many updates to Quick ST is because as soon as anyone reported a bug, we fixed it. A lot of people on Compuserve, Genie, and Usenet have responded over the last 3 or 4 months, and I personally have tried it with every version of GDOS and DTP package I could find.

It does support multiple fonts, and speeds up text string output by a factor of 12 in monochrome, and 15 in color! If you have a blitter present there will be speed ups in GEM, but the text routines do not make use of the blitter. Quick ST does work with the Turbo 16 accelerator, and gives you up to an additional 50% speed increase.

Unlike what the makers of Turbo ST claim, Quick ST is not 100% compatible with all software. To do that, it would have to be written in the eact same slow manner that TOS is written in. You have certain tradeoffs when you try to gain such speed increases. The makers of Turbo ST would have you believe that their product is 100% compatible, and although that is _almost_ true for version 1.6, earlier versions like 1.4 were plauged with problems, not to mention that they were much slower than even Quick ST 1.2.

Quick ST was first to offer things like separate mono and color versions, fast line drawing, AUTO folder versions, Hyperscreen support, multiple font support. From that we've seen recently, Turbo ST is now playing catchup in these areas and growing larger all the time.

<sales pitch off>

So, please consider the Quick Utilities and support the shareware efforts of myself and Ignac Kolenko before you buy any other programs. We have chosen to go the shareware route rather than sell this software commercially, but that doesn't mean it's free or public domain or that we don't have development costs.

I came across the discussion on PC-Speed and one message did mentioned that the PC-Speed using V30 CPU and has a socket for the Co-Processor. Does this mean that I can now run the Programs which require the Co-Pro such as: Track Load, AutoCad Released 10, etc on Atari computer. I am using the MEGA $ with Megafile 60.
Could any kind soul tell me the Address of the PC-Speed Maker in Germany? I believe that it would be less expensive to mial order it from Germany. The price in England is 349 English Pound (My Pound Sign did not work on VT 100 Emulator) and it cost nearly $400 in U.S.A.
Thanks in advance, S. Sujarittanonta, School of Architecture,
National University of Singapore.

Just a bit more on that compress vs TOS 1.4 incompatability claim: I'm running rom-TOS 1.4 version of 6 April 1989 (my birthday, strangely enough!) and as I mentioned earlier, no problems w/ compress. Are the people having problems running floppy-based TOS 1.4 (the developers' version) on 1040's or 512's ?? You may simply be out of memory if so... compress.ttp is a small file (16 k) but a large executable (> 480 k or so). It has an absolutely huge BSS. Run size on it for details :-).

hoping this helps,
Ross

1760. problem with interrupt programming

Newsgroup: comp.sys.atari.st
Date: 1989-10-18 20:08:39 UTC
From: roeder@sbsvax.UUCP
Message-ID: <1154@sbsvax.UUCP>
Source record: 248182

I have a serious problem with the keyboard interrupt and the 200 Hz timer.

What i want to do is the following:
Every time when a special key (eg. ^C) is pressed (thus giving a signal to the running program) call a 'signal-handler' (which may decide to not interpret the key). The signal-handler is provided by the actual running program. Also the special key to look for is specified by this program.
This is what i already have:
A new ikbdsys-handler calls first the old ikbdsys and then tests the character returned against a global var. When the special key is recognized and several other constraints are satisfied (the running process is my own program, there is no other signal pending and the user has not specified that the next character should be interpreted literally) a global flag is set.
Another routine in the VBL-queue checks the global flag and also some other conditions (again wether act_pd is my own program and the program was in user-mode when the VBL-routine is called) and then arranges everything such that the programs signal-handler is called after the VBL-interrupt is finished (with the same SR as before, especially the program is in user mode and so not at the os-level). Before the users handler is called, pending input is consumed with Bconstat/Bconin.
Now to the problem:
When a key is pressed, ikbdsys is called. But when you hold down the key, thus getting another ^C via the keyboard repeat you don't get a new interrupt. This is because the keyboard repeat is done by the 200 Hz system-timer interrupt.

??
?? How can i get ALL characters send to the Bios before they arrive there ??
?? and before they can be (mis-)interpreted by the operating system ??? ??
??

For example, when ^C is pressed during screen output (with Fwrite), it should not be seen by the operating system (because the os would otherwise terminate the actual program).
I know already how to use etv_term to ignore ^C. But i don't want to use this, because i want to be able to interrupt a program at any time (even in the middle of a large computation) and i want also be able to continue the program after the ^C-signal (and getting another signal at once due to the keyboard repeat). With my current implementation the repeated chars get through to the user program where i have to interpret them a second time.

Does anybody out there know how to avoid this ?

Hoping for an answer
- Edgar

(From "The Masked Rat Fink" "Computing and Informatics Yr4")

Can anybody tell me the following:

1) Did this message get through?
2) What is the latest version of Sozobon C?
3) Does it support GEM? I know it supports gemdos, bios and xbios but I
can find no reference to its GEM (AES & VDI) functions, or do those have
to be included by using the ASSEM command?

Thanks in advance

The whole GDOS font concept is now dead in the water (actually, it was dead
earlier this decade, with those TeX metafonts.) Even the new font things
on the Apple, nice as it sounds, has some flaws. The fonts you ask for
are pulled off the disk, and if they are not there, they are built and saved
to disk. Obviously, this can result in some severe slowdowns. A better
way would be to make the letters and cache them "on the fly." But I'm
getting off the topic.

Newsgroup: comp.sys.atari.st
Date: 1989-10-19 06:52:50 UTC
From: hase@netmbx.UUCP
Message-ID: <3626@netmbx.UUCP>
Source record: 248193

In article <891014.11320557.073300@SFA.CP6> Z4648252@SFAUSTIN.BITNET (Z4648252) writes:
>1. What memory chips should be used for upgrading the ST2 to a ST4
> if used with the T16?

1-Megabit chips (51 1000, 41 1000) with 120 or 150 nanosecond access time; do not worry about "page mode" or "nibble mode" types: these are special, faster read/write modes for the RAMs, that are not used by the ST MCU. Any type should support the "standard" read/write cycle.

The ST timing is made for 150 ns RAMs. Faster RAMs may cause problems: the faster the RAM chip can produce/take data (read/write cycle), the faster it must go from "power down" state (about 30 to 40 Milliwatts) to "power up" state (around 300 Milliwatts). This means, the suppy current has to jump from <8 mA to ~60 mA; this leads to voltage drops on the power lines (the faster the jump, the less power left for the RAM...)
The 1985 Rev. C 520 ST+ did not cause a lot of trouble when the capacitators for each RAM were replaced with 200 nanofarads.

If You want to "recycle" the RAM chips for a new machine (there *will* be another computer in Your life!), get fast chips (70 nanosecond) and a bag of 200 nF capacitators; solder the capacitators between Vcc and Vss under the RAM socket (on solder side of the PCB); if it does not work, solder a second capacitator to every RAM chip; this gives 400 nF per chip and should be all You need.

>2. Should the chipped TOS 1.4 be transferred to fast EPROMS to gain
> maximum results from the T16?

Well, the fastest bus cycle of the 8 MHz 68000 MPU is about 250 nanoseconds long (do not have the specs at hand, maybe its a little less), so the acces of 250 ns ROM/EPROM does not require "wait states" (think about a loop, that fills all registers from memory; with "no wait" the MPU speed is the limiting factor, not the memory speed).
However, the 16 MHz MPU is twice as fast; if the memory can produce/take data at the doubled speed, You'll get no wait states, too. Of course a faster ROM is necassary to handle this speed.
200 ns ROMs/EPROMs will do it with a little trick: the acces time of EPROMS is measured from the activation of -CE (Chip Enable, low active): 250 ns after -CE the data outputs will be valid.
You can think of -CE controling a large transistor that switches the power to the chip on and off; disabled, the chip is sleeping (and taking less power, producing less heat), -CE awakes it.
Now, there is another control input, called -OE (Output Enable). This one enables the output drivers of the (awake) chip. If the chip is held awake (-CE constant low), the acces time (after activation of -OE) is a lot (!) faster than nominal speed. Its less than half the nominal acces

time.
The chip is now twice as fast: it can catch up with a MPU, that is twice as fast.

The faster adress decoding and timing is - of course - not handeled by the ST chip set. The accelerator board has to provide the new control lines.

>3. Should the Atari blitter be replaced with the newer?
Hmm. Terra incognita, data input required. :-)

>in certain countries. I'm sure this third-party has put a lot of
>effort into making it compatible with the MS-DOS "real" Turbo C.

The company which sells Turbo C for the ST in Europe was called
"Heimsoeth" and NOW calls itself BORLAND GmbH. I assume that Borland
in the US does know about it.
Secondly the code for the parser on the ST is the same code used for the
compiler on the PC.

>Now, the eighth-hand information that I've gotten (NOTE: DISCLAIMER:
>THIS ISN'T FIRST HAND INFORMATION) is that this third-party ST product
>is second rate... or at least it doesn't meet "American standards".

OK let's have some "American standards" :-) (this is going to be fun)
Laser C
Lattice C
Word Perfect for the ST (buggy !!!!)
All "good ol' American" compilers are inferior to the Turbo C compiler.
Not because of the all American parser of Turbo C blows them out of the water,
but because the people in Germany have put a considerable amount of effort
of making a code generator which produces good and fast code.

>If this is true, I'd understand why Borland wouldn't want to get
>embarrassed by shipping it here.

Maybe because they cannot make such a fine product with a giant staff.

> (I am, obviously, writing this from
>the states). Then again, maybe they just don't have the (VERY BIG)
>staff required to properly support a product. Then again, maybe
>they're shooting for a different image than the ST can provide.
>Then again, maybe I should stop conjecturing and post this.

I am obviously writing from Europe (The Netherlands) and I have the
compiler installed on my computer.
The only other compiler I sometimes use is Mark Williams C (only for the
source level debugger), but when BORLAND GmbH releases the Turbo C source
level debugger somewhere at the end of this year, I will also abandon that
compiler.

I must emphasize that I do not work for Borland in Germany or get any money
for this from anyone. The AIM-people bought it for development of the

program and it gave the best performance of all C compilers we tested
(MWC, Laser C, Megamax C, Lattice C).
I am VERY pleased with this product, and I think people in the States
should also profit from the excellent software which is developed in
other countries. The Atari ST is a very popular computer here and it is
somewhat logical that also very much software gets released here.
So don't be afraid, pick up the phone, call Borland in Germany, tell them
you want their compiler and try it for yourself!
The phonenumber is in one of my previous articles.

Robert

1776. SPUFILE 2.0, C questions

Newsgroup: comp.sys.atari.st
Date: 1989-10-19 09:40:20 UTC
From: glk01126@uxa.cso.uiuc.edu
Message-ID: <111500042@uxa.cso.uiuc.edu>
Source record: 248198

Hammering out SPUFILE 2.0, I need some tech advice.

1) Does Malloc(-1L) not work properly?
I get various values after deleting a wide array
(Mfree) of buffers, e.g. 16304 free. Then after
creating another of size ca. 512, I get back to
the normal 100K+ value. ??? Is it my program?
(probably)

2) Is there anyway to register a continual pressing of
a dialog button without an event_multi to check
position and state of the mouse, then checking
if it is in button area?

3) Is there a problem reading from PC format disks. Some work,
others give some bs when doing fsfirst(), fsnext().

4) Using Laser C 2.0.

People interested in SPUFILE 2.0, send your requests. It is
a shareware program I have written with a gem interface. It
reads files from a variety of types of disks including Aladin
1/2 sided, Magic Sac 1/2 Sided, Atari/PC 1/2 Sided or Spectre
1 sided disks and holds as many as fit in memory. It then
writes them back to any of the above type disks on command.
Like two continual file selectors, one with files in memory,
the other with files on disk. If Dave Small is interested, I'll
add Spectre two sided support and send it two him for distribution.

Does anyone have the necessary c-code and instructions to turn
it into a DA also?

Thanks in advance.

-Spieu!

1777. Re: SPUFILE 2.0, C questions

Newsgroup: comp.sys.atari.st
Date: 1989-10-19 09:40:24 UTC
From: glk01126@uxa.cso.uiuc.edu
Message-ID: <111500043@uxa.cso.uiuc.edu>
Source record: 248199

ADDENDUM to note:

Files written to STdisk if read from mac are
FILENAME.MAC
FILENAME.MRS
FILENAME.MIN

the .MIN file contains the original mac name (now converted
to 8 chars, uppercase) along with finder info and attribute bits.

If the R box is selected, .RSC or .MRS files with the same
FILENAME portion will automatically be read along with the
FILENAME.EXT file. In addition if the FILENAME.MIN file is
in the directory, it will be parsed for its information.

When written to a mac disk, an ST file will be converted to
filename (lower case) and the RSC included if there is one.
(I don't know if there is any use for that unless macGEM comes
out).

Deleting files from disk or memory is an option as well as a
move selector which deletes the selected files from memory
after copying to disk.

Any other options any one would like to see? Information on
the current 'checked in' disk is also shown as well as free
space, block size, total space, free memory and files in memory.
10 files of disk and memory each are shown on the screen at once.
It only runs in monochrome now. Any requests for color? The
resource seems messed up in medium, don't know why. Used RSCTOC.TTP
from terminator.

Could someone please go into some detail about the programming environment
that Turbo C offers. Does it have a built in editor, or are you allowed
to substitute your own (without an unacceptable loss of features). Is
it a CLI environment (like MWC) or a GUI. If it has a build in editor,
is it gem based, does it allow marking blocks with the mouse (like Laser C),
does it allow multiple windows, macros, ...?

For whatever reason, it doesn't look like we are going to get this program
distributed in the USA, and hence I'm not going to be able to base my
decision to purchase it on magazine reviews or store demo's.

(Oh, yeah - any comment on the documentation and 'ANSI-ness' of the compiler
would be appreciated).

Thanks

Once is annoying, 5 or 6 times in a few months is TOO MUCH.

(1) Some people have to pay for their news feeds =>
sending Ads outside the appropriate news groups is unsolicited junk mail
that costs the *reciever* money. You wouldn't FAX it to some-one
don't stick it in a non-ads newsgroup.

(2) IF YOU DON'T KNOW HOW TO RESTRICT DISTRIBUTION TO THE BIT OF
THE WORLD WHERE THE PRICE IS IN LEGAL TENDER - DON'T SEND.

Long-distance bandwidth is limited and also costs money. Junk mail
makes funding agencies twitchy. An Ad for North American ST (the
vast majority of offenders I'm afraid) is about as useful in Europe,
Australia, New Zealand, Iceland, Venezuela, ... as an Ad for a spare
left-hand drive Haggis outside Scotland.

The bandwidth wastage is amplified by the stream of frustrated
complaints :-(

Come on folk, lets have some consideration round here,
USENET is what it is precisely because ``net'' = ``the world''
rather than ``my backyard''.

You can certainly exclude ``lack of quality'' as a reason why Borland aren't marketing Heimsoeth's Turbo-C outside Germany. It has become something of a hot property on the ripped-off softwate circuit in this country *despite* being in German. What have seen of ripped-off copies suggests it is probably the best C compiler / environment around for the ST at the moment.

Good editor,effective shell, good debugger, a decent assembler, a stand-alone compiler and linker for command line work, narry a bug, fast compilation, fast code, ...

This is a class package (made in W.Germany?). I can only encourage those hardy ST anglo-american ST users who're going to buy it anyway to do so. The software is pretty much self-documenting anyway - even with menu's in German. I can only assume Borland's reluctance to market this *product* (only a bit of tech. translation required to sell) is due some brand of technical or national chauvinism. It is, after all, a well known fact that people in the old-world can't understand computers. Big-important-serious-business-expensive-company-itis may also play a role.

Andrew Stevens

PS
How about organising a short English summary of the manual over the net? Evidence of honest ownership would of course have to be supplied to the translator. I'd be happy to do the translating but can't afford Turbo yet (Sozobon for a few months more). If anyone is interested in loaning a manual please e-mail. IT WILL NOT BE PHOTO-COPIED ETC - turn-around 1 week.

Let me add some corrections & explanations concerning Turbo C ST
(I use it, and I have talked to the people at Borland Germany)

limonce@pilot.njin.net (Tom Limoncelli) writes:

>When Borland ported Turbo Pascal to the Mac, they did a real port,
>hired 680x0 experts, etc. This "Turbo C for the ST" is a third-party
>that made a C compiler for the ST

Partly true: TC ST started as a independent developpement, but has been
taken over by Borland Germany; at least the stand-alone CPP and the
parser part are said to be _now_ (replaced by) direct ports of TC PC.
(You can see this by TC STs ability to (optionally) recognize
keywords like 'far' or 'huge'.)
Code generation, editor et. are independent products.

>and is having it marketed by Borland in certain countries.

Borland is not a single entity: Borland GmbH, the German distributor
of Turbo software incl. TC ST, is - I think - quite independent of
Borland USA (they just switched their name, which was "Heimsoeth GmbH"
before).
Borland US doesn't make ST software, Borland GmbH does.

[By the way, since TC ST is priced very low, dealers have only a
small margin, so they often do not carry it (or have outdated versions).
I got mine via mailorder (really: I called them, they _reserved_ my item,
so 3 days later(!) I could drop in and fetch it) from Borland GmbH,
and they do international mailorders too. I think there is an english
speaking version of program+manual+onlinehelp available.]

>Now, the eighth-hand information that I've gotten (NOTE: DISCLAIMER:
>THIS ISN'T FIRST HAND INFORMATION) is that this third-party ST product
>is second rate... or at least it doesn't meet "American standards".

Nooo. There have been some bugs in version 1.00 - You wouldn't have
thought so :-) - but now version 1.10 is out and ok.
TC ST is a better compiler than I dared to dream of before!
(Ok, I have some personal objections against their integrated editor,
so I don't use it, preferring Tempus instead.)

>Then again, maybe they just don't have the (VERY BIG)
>staff required to properly support a product. Then again, maybe
>they're shooting for a different image than the ST can provide.
^^^^^^^^^^^^^^^^^^^^^^^^^^^ in the USA !

Remember, there are vast differences in the image the ST got in the US and in Europe: here you find STs almost everywhere in the scientific and technical sector (see this article about the brand new lab equipment - they use a ST to controll it; see the picture of the famous Prof. VeryImportant at his working place - and the ST on his desk; GEC recently proudly presented their new LCD car display showing a digitized odometer - but what are those little drawer icons near the left edge :-) You get the picture.

I know that You believe You understand what You think I said, but I'm not sure You realize that what You heard is not what I meant.

1784. reviving HPdeskjet cartridges

Newsgroup: comp.sys.atari.st
Date: 1989-10-19 12:52:08 UTC
From: idh@NABLA.ELECTRICAL-ENGINEERING.UMIST.AC.UK
Message-ID: <8910191352.a003368@nabla.electrical-engineering.umist.ac.uk>
Source record: 248056

Unfortunatley the time I discovered my Deskjet cartridge needed refilling was when it ran out. It was reported earlier that such cartridges are poor candidates for refilling. The problem being that they become unreliable, in particular they may work immediatley after refilling, but not the next day. Why ?. I thought it may be due to a bubble of air forming beneath the gauze filter that lies above the printing element that forms as the cartidge finishes it's last drop of ink. (It runs out quite suddenly). To cure the problem I removed the top, took out the sponge and washed the cartidge and sponge in water. Next I put some ink (Parker permanent black 'Quink' seems OK) into a saucer and put the print head in it, then sucked on the top of the cartridge till ink came through the gauze. (This is why its a good idea to wash the cartrige, otherwise you may get ink on your face with comical effect). Next the sponge went back in place after being squeezed dry & more ink was injected into it till the surface of the sponge appeared damp when squashed slightly. The cartridge has worked reliably since (about a week now).

Disclaimer: I can't say that this will work with, (or be good for) your printer. It seems OK with mine.

Correction.....I wrote the article about PC-Speed and I said it might contain a socket for a co-processor. Well, I went back for a second look and that second socket is just that a second socket. It is not attached to the board so I guess it is not for a co-processor. Sorry if I might have misled anyone. I looked briefly at the instructions and could not find out what the extra socket was for. Maybe someone else has a better idea.

I heard a rumour that Borland offered Atari US a fully English version of Turbo C for something like $1m. They have no interest in marketing it themselves in a small market like the NA ST market. Of course, you can imagine that Atari US was not ready to dig deep for a single ST program. Can anyone from Atari US confirm or deny?

By the way, will the German distributor ship to NA? If some clever soul would publish an English book on how to use Turbo C (not, mind you, a translation), perhaps we could make do with a German version. Personally, I don't mind reading German anyway.

Atari did try to market to the USSR, from what I've heard. The problem was that GDOS was not really ready yet, and all of the cyrillic stuff was a weak hack. I understand that a Danish/British computer called Thor, which does work well with cyrillic, has taken a lot of the USSR market.

> especially would like to see Spectre GCR roaming in 16 Mhz.

The Spectre GCR works with all of the currently available 16
Mhz processor upgrades. Just don't expect it to run twice as fast,
most of the upgrades only offer about a 5% performance increase. The
upgrades are really limited by the low performance of the memory in the
ST (low compared to a 16 Mhz CPU). As far as I know only one of the
upgrades supplies a large performance boost since it has 32K of cache
memory, that allows the CPU to run at 16 Mhz with no wait states most
of the time. With the cache the performance increase can be as large
as 100%, the average boost is about 50%.

> Any help appreciated.
> Lea 'LadyBug' Viljanen ____ University of Helsinki, Finland

Lea, there is a problem with replacing the 2 chip TOS 1.2 with a 6 chip
TOS 1.4. In some, not all but enough, Mega STs you need to replace the
74LS373 ics with 74 AS 373. repeat place the LS with AS. AS have a higher fan out
and can drive the additional load presented by the additional 4 EPROMS.

This is a kludge and is known by Atari, but it has to been done when you
install the new TOS if they fail.

Good luck..

Thanks to Anthony Howe for his fine example of right button processing.
I wish that more examples of tricky ST programming would be posted
on this newsgroup.

In particular, I would like to hear from other people who have tried
the 'vdit' program posted awhile ago. 'vdit' was an example in loading
GDOS fonts, but it didn't appear to work. I would like to write a small
utility to print out a sample of each GDOS font in your collection.
So, I need to be able to load and unload GDOS fonts (both screen and
printer) and then dump a sample to the printer.

Any ideas out there??

I've gotten a lot of mail about my response to Larry Rymal's note (<891013.16005173.072949@SFA.CP6> from Z4648252@SFAUSTIN.BITNET). Whew! So now I know what DC squish exists for.

OK, I fell into the trap of only reading one posting before posting a reply. A moderately critical one, too. But go back and read the original article yourselves - Larry doesn't say anywhere that DC squish exists to create self unpacking compressed executables. I guess I was just sorta supposed to guess that, or read his mind, or know it already, or something 1/2 :-).

But he did talk a lot about the compression ratios and the interface. There's a table of before-and-after sizes, and so on. So I thought, "Hey, this thing is a compression utility. Let's compare it to the old standby." And as a compression utility, the performance is in my opinion not worthy of Major Wow Reviews. If it's not a compression utility, then of course comparision to a compression utility is meaningless. I'll let each of you make your own decision on that point.

So as something to make living on floppy-based systems bearable, I completely agree that DC Squish sounds like a winner. I guess I'm out of touch (been a _long_ time since I tried to do anything on a flop based system - at least seven years, I think). So no more mail on this subject please. The offer of compress stands.

Ross

Yes, Spectre GCR will work nicely with a faster processor. Apparently, the Turbo16 (FAST by Jim Allen) board will speed up Spectre by a very noticeable amount. It will allow you to play sound at the same speed as the macs! My info is from Mark Booth, sysop for the GEnie Gadgets by Small RT. I'm pretty sure he said it is just a hair slower with Turbo16 than the equivalent macintosh 16MHz board.

Don't know about the other 16MHz boards.

Hi,
I just have two simple questions.....

First: I have a standard 520 St w/40 meg supra HD. will I get more life
out of my drive if I leave it on all the time (except during
storms, o'course) or is it okay two power it down when I'm not
using the system ? (I power up 2 to 3 times a day).
Should/could I leave the whole system on all the time ?
I'd really like to know so's I can keep my HD going for years
and years and years and yea...(bap!!!)

Second: After I've been typing for Oh...say 10 mins or so the key click
sound gets louder then dies, maybe to fade in and out a few times
but mostly it stays quite until I power down then back up (reset
don't do a thing). Is this my sound chip(whatever they named it)
or are the key clicks some other hardware?

> mother board? If so, is my machine totalled???

My power supply once went bad and sent 20 volts thru the 5 volt line.
Fried half the chips on the board. The service people didn't even try
to fix it. Instead, it cost me about $200 for a new one. But they had
to send the old one back to Atari and I had to wait a month or so.

On the plus side, my original ST was a very early model without RF.
The replacement was a little more up to date, so now I could videotape
my adventures on Time Bandits. Yay.

Hello People,
I recently saw mentioned (by Peter Szymonik) a program El-Cal
for mathematical use, is this a native ST program or does it require Spectre to
run it under Macintosh mode. I am very interested in this and would like any
info going.

Secondly, are there any good repositories of GDOS fonts out
there, as I am a little short at the moment? The ideal solution would be a
prog which converts Pub Partner/Pagestream fonts to GDOS ones, this would
enable a full set to be produced for screen and printer from one vector font,
does such a beast exist? If so where can I get it from. Any solutions would
need to be mail accessible as I cannot FTP from the UK.

Thanks for all the help.....Phil Woodall

1808. Twister & TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1989-10-19 19:13:30 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <10069@stag.math.lsa.umich.edu>
Source record: 248080

I was curious, supposedly TOS 1.4 was going to fix the timing
problems with floppy disk I/O. (Seek w/ verify instead of plain old seek, etc.)
Well, just fyi, from Quick Index 1.5: using double sided disks formatted
at 80 tracks and 10 sectors per track, I get:

Normal Twister
GEMDOS 100 100
file creation
DMA speed 100 181

So I guess I'll keep on formatting my floppies with the Twisted sector
skewing...

1809. Problem with LaTeX and letter.sty

Newsgroup: comp.sys.atari.st
Date: 1989-10-19 19:21:14 UTC
From: csrobe@CS.WM.EDU
Message-ID: <8910191921.AA18486@cs.wm.edu>
Source record: 248081

Greetings-

We have just installed newer versions of TeX and LaTeX on our Sun
network and we've noticed a problem with writing letters using the
LaTeX style file. I appears that the new version does not place
any vertical space between the \closing and the \signature for
a person's handwritten signature. We take the same file and run
it through our old LaTeX and it works as expected.

I have also seen the problem in the C TeX version that is on the
ATARI ST using the same style file.

Here are the version statements from the OLD stuff:

This is TeX, Version 2.0 for Berkeley UNIX (preloaded format=lplain 87.2.1)
LaTeX Version 2.09 - Released 19 April 1986
Document Style 'letter'. Released 21 July 1985

Here are the new version numbers:

This is TeX, C Version 2.95 (no format preloaded)
LaTeX Version 2.09 <4 Aug 1988>
Document Style 'letter'. Released 21 July 1985

Can someone please tell us how to solve this problem? Do we need a newer
style file, a patch or what?

Many thanks!

1810. More Internationalization of Software

Newsgroup: comp.sys.atari.st
Date: 1989-10-19 19:39:27 UTC
From: terrell@cadnetix.COM
Message-ID: <9995@cadnetix.COM>
Source record: 248082
Cross-posted to: comp.sys.ibm.pc,comp.sys.atari.st

More "Internationalization of Software" questions:

I: Computer Printers

It's clear that European paper sizes are different than in the US.
However, what about popular computer printers: do they tend to
(at least by default) print pages of 66 lines by 80 columns?

What are the dimensions of the tractor feed paper that is loaded in
the printers?

II: Software Documentation & Orthography

How does documentation differ in Europe? Do US software developers go
to the trouble of converting to British spelling? Do British users
resent it when they don't? Or perhaps the users don't care?

Note that I'm talking only about the documentation. It's clear that
(for example) a spelling checker would have to be converted to British
orthography.

Does US software/documentation usually get translated for countries that have
relatively small user communities (e.g. Sweden)? If the answer is "No",
would translation of a product give it a great competitive advantage
over a similar, but non-translated product?

Is there a big market for third-party native-language software
documentation? In the US there's a big market for third-party software
documentation because pirates don't like reading loose xerox copies, and so
much software documentation isn't very good in the first place.

III: Product Introduction

After reading several overseas computer mags, I get the impression that
(to be sarcastic) Europe is used as a beta-test site for US-developed
software. I own SPRINT 1.0 which I believe is the most recent version
available domestically, while users in Europe are using version 1.5.
I've seen other cases... Does the European user community tend to get
US products before their counterparts in the US? If so, is there a bias
against US products due to buggy initial versions of software being
offered first in Europe? Or do European users appreciate the chance to
work with more recent versions of software?

Once again, thanks in advance.

I will try to post a summary of this dialog. Unfortunately, the results
of this discussion two months ago have been dropped into the bit-bucket.

Terrell

This only returns the size of the largest chunk of free memory. So if you have holes in your free memory (non-contiguous) then it will return a number smaller than the total of all free memory.

From: weber_w@apollo.HP.COM
Message-ID: <4653a8ee.20b6d@apollo.HP.COM>
Source record: 248084

In the referenced article ben@cit5.cit.oz (Nino Benci) writes:
>Can anyone please help me with info on converting the Atari ST DMA port
>to something which looks and operates like a SCSI port.

The Atari DMA port (ACSI) isn't SCSI. Its layout of the command block does not reserve the first byte for the OPCODE, but instead places the target logical unit number in the high 4 bits and the opcode in the low 4 bits of the first byte. There are also differences in the physical connection, but I'm doing this from (very hazy) memory and don't wish to mislead you.

I believe that the best approach for you would be to use either the ICD disk controller or the Berkley Micros Systems 200 disk controller. I KNOW that the BMS 200 will permit you to issue full SCSI commands, and I suspect that the ICD board will also permit that (assumption is based on ICD's tape backup system requiring SCSI commands not permitted in the ACSI scheme).

I haven't any information on how to purchase either of these in Australia. I would, of course, be willing to purchase one here for you if you will fly me there to hand-deliver it :-)

> Rich (Proud owner of a souped up T16ed Mega ST4!!) Covert

First, TOS 1.4 is a product. GDOS is a product. They are COMPLETELY
independent of each other.

As for the serial port, We found the problem and we fixed it via the
TOS 1.4 patch. Unfortunately, it was not found until after the release of
the ROMs. To verify this, we did not receive a single SPR on this problem
from the developers that had the Beta version of TOS 1.4 or any reports
from anyone until AFTER the ROMs had been finalized.

But, the end result is that the problem was reported, we looked into it,
found there was a problem, fixed it, and released a patch program via the
Networks and Dealer Network. What more do you want from us??

1818. TT

Newsgroup: comp.sys.atari.st
Date: 1989-10-20 00:56:39 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <4116@blake.acs.washington.edu>
Source record: 248090

I do NOT mean to offend anyone by talking about 386 boxes...
but I can't believe I am the only one sitting anxiously
waiting for the much-too-long awaited USA announcement of the TT.
Of course, I KNOW i am not.

Opposite the Portfolio ad I saw this morning, there was an ad for
the following:

80386 (NOT the "SX")
25Mhz
1MB RAM (expandable to 8 MBytes)
1.2 MB floppy
101 Enhanced keyboard
Serial and Parallel ports
VGA color monitor and card
8 expansion slots (1 x 32 ; 5 X 16 ; 2 x 8)
60 MB 32ms Hard Drive

Price: $1995.00 (delivery: 3 days)

Granted, it doesn't run TOS 1.4 ... but it EXISTS!

Thinking I might keep the ol' ST in the basement studio and
put a 25Mhz Unix box in my office.

Unless, of course, ATARI offers the TT at a price I can't refuse!

No flame against ATARI... just a hanging around a few moments longer
for THE ANNOUNCEMENT before I move on....

>
>Generalising these numbers, we might conclude that it is people who
>think good software should cost less the $100 that are "just plain ..."
>--

Actually, I conclude that the problem lies with the way Lotus wrote their software..... They welded the sw to the HW platform, which not only made ports difficult, but helped make "compatibility" into the curse of the PC-DOS world. (100 man-years to port is the price you pay for squeezing that extra bit of performance out of IBM's sluggard son)

Even Lotus's current products show the old school attitude when compared to Excel & others.. (I canned Lotus at 2.0?) Excel is virtually device independant compared to lotus. I have no sympathy for applications that insist on reinventing the user interface. It will prob be running on 4 or more O/S (Including unix) while lotus is still working on the latest rev. for dos.

Not that Excel is the perfect sw package (Just better than most :->), but in most cases, the more rules (O/S, bios, etc) you break, the more trouble you will have porting.... (every programmer knows this, we just do it anyway!)

So.... I *do* believe that good sw can be cheap & portable!
(and *no*, I do not work for a SW company :->)

Well, unless you are a diehard Atari fan (I know, there are still a few left), I would advise you to buy the 25mhz 386 now (if you do indeed need it now). Besides, if you want to use it for work you would be much better off with an industry standard 386 rather than the TT (if it ever does hit the market). You'll be able to get software for nearly every application at reasonable cost and not have to worry about the lagging support of Atari Corp and vaporware promises. It is really to bad. The 68030 is such a nice mpu compared to the Intel mpu's. (add ^ an o here) Besides, who needs another workstation with non-industry standard 16 bit slots. C'mon...what a waste...Although I would like to see the TT fly, I don't think you will see it happen (That is IF you ever see a TT up close and personal...Ha!)

Now that I've got my own little 68030 worksation (named after a popular red fruit <grin>) and have it actually in front of me (yes, you can actually see and touch it!), I can't believe how slow my ST seems in comparison. All I use my ST for now is Air warrior and an occasional game. Best of luck in your computer search!

They DO have IBM-compatibles in (technical)schools. At the time I bought my
520ST (In the early 1986), you weren't allowed to sell a ST to USSR. I think
it was because of the Motorola prosessor. At that time it was too much 'high-
tech'...

However, I'm not independently wealthy. Not only will the TT be cheaper than its fruity computer equivalent, but I can save my _substantial_ software (not to mention programming time) investment and continue to use my hard disk without hacking it to bits first.

You're right about the 68030. I'm not going to buy an Intel chip based machine. Yecccch! Even though the 80386 _can_ have a flat address space, about 95% of the machines out there are running 8086s so the software people don't yet have much incentive to write '386 enhanced software.

>Now that I've got my own little 68030 worksation (named after a popular

Sure, Mac IIx, cx, and ci machines are nice. They're also _really_ expensive. If the TT truly has VME slots (yes, they _are_ a standard, even at 16 data bits)and SIMM-based memory along with 512k of ROM space, it will be quite user expandable. We'll be able to plug in new and better graphics cards, run UNIX with hardware memory protection (built into the '030), and expand our memory quite effectively. With the SCSI port, we'll have cheap hard disks, and the built-in video modes are nothing to sneeze at.

Hello,

mail to chad@decwrl.dec.com bounces, so, since this might be of
american interest, I send it to the list. It is an information
about price and availability of Turbo-C for Atari ST in Germany.

------------ original mail to chad starts here ------------
Hi,

in Germany, Borland products are sold from many firms, but the
original distributer is Heimsoeth in Munich.

Heimsoeth Software GmbH & Co. KG
Lindwurmstrasse 88
8000 Muenchen 2
++49-89-72010-201 or
-202

The price is DM 228,- (about $115,-) for the Compiler and DM 342,- (about
$170,-) for Compiler, Assembler and Debugger, but I am not sure, whether
the debugger is already available.

If you are interessted, I can send you address and phone number of the
firm in Munich, which ported the whole thing.

CU Carsten.

>This only returns the size of the largest chunk of free memory. So if you have
>holes in your free memory (non-contiguous) then it will return a number
>smaller than the total of all free memory.

From what I have found out Malloc (-1L) returns the *sum* of the
sizes of *all* free memory chunks. So, what you should not do
without further checking is as follows:

```
buffer_size = Malloc (-1L);
buffer_address = Malloc (buffer_size);
```

This will not work as intended because the second Malloc will
result in a pointer to the largest available chunk only, not to
all the free memory, because the latter is not neccessarily
contingous! So the buffer located at 'buffer_address' does not
have a size of 'buffer_size' but of some smaller value. The
real buffer size you can estimate by adding another statement
to those above:

```
real_buffer_size = buffer_size - Malloc (-1L);
```

Disclaimer: I still use TOS 1.0.

I'v used Prospero's Fortran for several years now, and find it
reasonable. One of the good things is the ease by which code can
ported too and from the PC without any changes if you use
their PC compiler as well.

The compiler is not the fastest around, but produces tight
code. The actual workbench is v.good, and I find it very
productive. The latest 'toolbox' from Prospero gives even
greater flexibility to this environment. They also have
MC68881 support as well.

Hope this helps

Chris.

I only use the product, I don't have shares in the company.

1839. REFILLING HP DeskJet Cartridges cont...

Newsgroup: comp.sys.atari.st
Date: 1989-10-20 14:53:20 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891020.08531954.007196@SFA.CP6>
Source record: 248011

It was mentioned that a cartridge was brought back to life which
was totally exhausted, i.e., no ink at all, totally dry. The author
mentioned that he was under the impression that such cartridges were
previously mentioned to be poor candidates for "recharging" due to
air pockets on the sponge, etc. His efforts, the removal of the top,
I believe and the washing out of the sponge resulted in his cartridge
coming back to life.
Ok.... the reason that I mentioned, several months back, that
exhausted cartridges were poor candidates was that they tend to be
'confused' on their siphon effect. Certain areas on the sponge
will be dry while other areas will be wet. This condition will remain
even when two ounces of ink have been added. Due to the concentration
of ink in certain areas, a "track" will form providing a quick access
way to the nozzles. The user ends up getting a dripping effect.
Really working with a dry cartridge by removing the top and washing
out the sponge will get rid of the dry areas, thus killing the siphon
effect. The cartridge will be restored.
As always, such restoration attempts involve some risk. The
cartridge is not "meant" to be restored and the nozzles have a certain
life cycle. Also, ink from a brand relatively unknown should never be
used. Hewlett Packard does not endorse (major understatement)
the refills, i.e., poor quality ink will result in crusting, thus
clogging up the priming tube.
Restoration of these expensive cartridges will extend their life
considerably. I've been on the same cartridge for several months.

Message-ID: <2513@csv.viccol.edu.au>
Source record: 248012

I have now seen about a dozen "For Sale" messages in comp.sys.atari.st since it started flowing into Australia again about a month ago.

I'm sure the newsgroup flows into other parts of the world, too, so could all those who are selling their hardware or software PLEASE MAKE USE OF THE DISTRIBUTION HEADER.

This prevents people who are not able to buy your wares, or are unlikely to due to the prohibitive cost of transportation, being subjected to what is for them noise.

If you were fully considerate of the subscribers to comp.sys.atari.st when advertising, you would use a distribution that mentions an area enclosing where you live, and having boundaries that are no more than a 3 hour drive away, as you are unlikely to sell to someone who cannot see what you are offering. Such a distribution might be named after the city or state in which you live. If you live in Los Angeles, for example, you probably have a newsgroup called "la.forsale". If this is the case, you could post your message to comp.sys.atari.st and la.forsale with a distribution of "la".

Please, consider that Usenet is not an infinite resource, and a noise posting reduces the value of a newsgroup.

See the regular postings in news.announce.newusers for more.

Atari could do something to make a lot of us happy, and get a huge marketing advantage with people who love their computers (blush) by announcing right now that at some specific date in the moderate future the specifications for TOS 1.8 will be frozen. All bugs known to Atari as of that date will be addressed; all new features will have been chosen by then. After that, it's up to the programmers. Sure, people will start getting impatient about 6 months after the drop-dead date, but that's about when the internal alpha testing should be starting, and that's a nice thing to be able to announce. Who knows, by having a definite freeze date, the development might even be helped.

Why not some ST developers work together to develop a
outline-font-based GDOS? If the version can b e accepted by all
developers as a standard, who cares what Atari think? It can be
used by any ST developers in their program, and Atari's attitude
will not be a problem.
Outline font technology has existed in the ST since pub. partner was
released. Meanwhile many other companies still struggle with the Atari
GDOS. There is no need to continue using that junk.

1843. 386 vs the TT

Message-ID: <8910210938.AA01163@ucbvax.Berkeley.EDU>
Source record: 248015

Several users on my site have fast 386 machines. The problem is that most codes do not support memory beyond 640K. Thus, a 4 meg 386 has over 3 megs of useless RAM.

PC people are always proud of fast 386's. With the lack of a common interface for applications (Word Perfect, dBASE, LOTUS, ChiWriter, etc.have no relationship to one another) huge amounts of time are wasted trying to pass data between applications. Who the hell cares if a number crunch takes 7 seconds instead of 21 when it takes 1/2 hour to move the result to a second application. Until PCs have a dominant common interface that allows rapid passing of data between appplications PCs will remain the dogs of the computing world.

A survey has shown that in business, the average number of applications used by PC users is 1, the average by Mac users is 4. Why? Learning one PC appl does not tell you anything about the next. Learning one Mac appl or one GEM appl totally prepares you for the next ones. Sorry PC users, speed of processing is not the only determinant of productivity!

1847. what to do with changed vectors on changing resolution

Newsgroup: comp.sys.atari.st
Date: 1989-10-20 16:58:50 UTC
From: me@dude.pcs.com
Message-ID: <ME.89Oct20165850@dude.pcs.com>
Source record: 248019

I have the following problem:

An accessory I wrote changes the mouse input vector for a mouse speeder.
It saves the old vector, takes the mouse movement, mangles the data
and passes them on.

So far so good, you even can uninstall it.

But if I change resolutions in color mode (e.g. low rez -> medium rez),
the acc gets loaded again and has no way to detect, that it had already
been started (at least not if I don't check for the system dependent
value of the old vec).
So the machine hangs when it tries to install itself again with the
already changed vector - it points to a piece of code that got removed
on changing the rez. (or am I wrong in that ?)

If I remove the acc before switching the resolutions, everything is ok,
but there should be a way to do it more elegant.

So my question is: What do other accessories, that change system vectors
in that case ?

>will not be a problem.
>Outline font technology has existed in the ST since pub. partner was
>released. Meanwhile many other companies still struggle with the Atari
>GDOS. There is no need to continue using that junk.

Yes, outline fonts are a really cool idea.
Yes, the are a whole HECK of a lot of work to implement.
Probably gonna be hard to convince the people who make Pub.Partner to
part with their outline fonts, as they are the only ones (that I know
of) out there... They pretty much corner the market.

So, who designs the fonts? Who do we get the fonts from, certainly not
Adobe... ;-} And then, what about the algorithm for scaling, that's
worth a lot of money, people make their living off of that...

Ok, so if you want outline fonts, wouldn't it make a whole HECK of a lot
of sense to make the system GDOS compatible? That way, all the existing
programs can continue to use fonts the way they always did...
BUT how do you fix programs like MicroSoft Write (and MANY others) that
inquire of the system what font sizes are available?

Here's the problem: Outline Fonts enable any point size to be created.
GDOS thinks only certain point sizes exist. Thus _currently_ a program
polls to find out the sizes available, and limits the user to those
sizes. As the Outline GDOS, what font sizes do you report on inquiry?
You've _really_ got _anything_, so why limit the system, but then how
does a program that allows the user to select from font sizes handle
the now unlimited number of sizes . Certainly not in the current
schema of "pick a size", as they can legally pick _any_ size.

Anyway, just some thoughts on Outline Fonts and GDOS.
I'm really preassuming that the Outline GDOS must stay GDOS compatible
and not break existing software, otherwise, I suppose one could throw
out all the currently available GDOS software...

Ritzert@DMZRZU71.BITNET writes:

>According to Allan, XXX must be exactly equal to the size of the FAT.

Please, this is a gross misunderstanding. If it *had* to be exactly equal to anything, we would have written it to compute that thing when it ran.

What I said is that there's little point in making XXX GREATER than the sum of the FAT sizes.

>Related question: is it possible with tos14 to increase the cluster >size, i.e. shorten the FATs dramatically and thus speed up the hd even >further? Will CACHEXXX support such a configuration?

TOS 1.4 FAT handling is so fast, you wouldn't notice. My God, it's DOZENS of times faster than TOS 1.2 FAT handling, and certainly acceptably fast in its own right! When the FAT is entirely cached, a Dfree() call on a 16MB partition takes under a second! That's fast enough for me.

HDX on release 3.01 of the Atari Hard Disk Utilities disk allows you to create partitions greater than 16MB in size. It accomplishes this by making "sectors" on the disk appear to be larger than 512 bytes. A cluster is always two sectors, but larger sectors means more data per cluster, and therefore fewer FAT entries. Not all disk utilities use Getbpb() to find out how big a sector is, so they won't all work with this kind of partition. For maximum compatibility, therefore, this feature only kicks in on large (>16MB) partitions.

CACHEXXX *does* support the larger sector size. No other cache program can, because it doesn't know where to look to find the sector size it should use. Don't use any other cache program if you have any partition >16MB created by this HDX.

FYI: on the disk labelled 3.01 you will find HDX's version number is 3.00 and AHDI's version number is 3.01. If you use HINSTALL to make your hard disk bootable, the version number you will see when it boots is 3.01. This is all well and good. If your hard disk driver, whether installed by HINSTALL or loaded from your AUTO folder as AHDI.PRG, says it's version 3.00, GET THE UPDATE. AHDI and bootable disks version 3.00 are DEADLY to data.

->
-> recently Allan Pratt told us about the existance of a FAT-Cache called
-> CACHEXXX.PRG. I have seen an early version of this program (supplied
-> with the first beta release of TOS1.4) running. It speeded up disk
-> accesses very significantly compared to standard TOS1.4.

-> o where to get it.

I got it off a local BBS. It came with other goodies such as MACCEL2 (a mouse accelerator), MAKEFAST (to set/clear the don't-clear-bss bit), and assorted patches. I will send the file to comp.binaries.atari.st, so everyone can use them. BTW, most of the programs are directly from Atari, and all work flawlessly with TOS 1.4. More than you can say for most cache programs! Good job Atari!

-> oo adjusting the XXX correctly.
->
-> According to Allan, XXX must be exactly equal to the size of the FAT.

Actually, its more like XXX should be *at most* equal.... If the cache is there, it will get used. XXX can be whatever you like or have the memory for. I have a 68 meg drive, and I'm not about to dedicate ~300k for a cache! I use around 150k, and it still speeds things up very nicely. I suspect even much less would do in a pinch.

-> How do I compute XXX exactly? What happens when the FAT size (in kB) is
-> not even? Example: my Seagate ST296N (slowww) contains 4 partitions of
-> 21.2 each. Their FATs take 81 sectors (1 sector = 0.5 kB), hence 40.5 kB.
-> Do I have to take into account the sizes of all the inactive logical
-> devices (floppies, hd partitions), too? (I run AHDI 3.01).

You also need to take into account the number of sectors used by root directories in each partition. Heck, live a little and use 50! It won't hurt.

-> Of course, comments of Atari officials on this subject are appreciated
-> very much.

This info is indirectly from Atari. Read the docs that come with CACHExxx (when you get them :-) and see.

Hope this helps. Look for the rainbow utilities in comp.binaries.atari.st!

I saw an article in Newsweek(?) about 8 months ago (?) about the USSR and microcomputers. It seems that some Russians are concerned about the growing "hacker gap" -- Soviet children aren't as computer literate as Western children.

And, although schools don't have the money to buy computers, there are a *few* Soviet citizens and groups that can. In particular, one of the Soviet chess champs bought a roomful of computers for the use of the children in his neighborhood.

>>>> AND THE COMPUTERS HE BOUGHT WERE ATARI STs! <<<<

Also, the Soviets are in the market to buy *thousands* of IBM clones for their universities. (A friend of a friend submitted a bid to supply them; he didn't get the sale, though.)

>So, who designs the fonts? Who do we get the fonts from, certainly not
>Adobe... ;-} And then, what about the algorithm for scaling, that's
>worth a lot of money, people make their living off of that...
Why _not_ Adobe? They've placed their Type I fonts in the public domain, I understand. You'd get a recognized standard and lots of proven-ground technology (in an area where proven-ground tech is good) right off the bat.
>BUT how do you fix programs like MicroSoft Write (and MANY others) that
>inquire of the system what font sizes are available?
Have the system throw a standard set of point sizes back? And when a particular size is requested, generate a pixel image. Not fast, but functional - and not necessarily as slow as you might think, either. I've seen other applications do it that way, and it's not too bad.
>I'm really preassuming that the Outline GDOS must stay GDOS compatible
>and not break existing software...
If it's reasonably written, the above system might save a lot of headaches. Then again, maybe not; I don't know GDOS.

> see the TT fly, I don't think you will see it happen (That is IF you
> ever see a TT up close and personal...Ha!)

Not only are 80386 PC computers available there have been some really great prices in misc.forsale for 25 MHZ 80386 computers with 1024 x 768 x 16colors color graphics. something beyond the power of a TT, I believe. Also, the ads I have seen indicate that the 80386 PCs have 32 bit, 16 bit, and 8 bit motherboard busses, so can use a whole spectrum of IBM PC plugin boards (things like hard disk on a card, internal modems, additional serial i/o, eprom burners, geez just all sorts of things that Atari customers are too cheap to want to buy!!).

I am waiting for UNIX Sys V with X Windows to hit it big on the IBM PCs.
I expect my next computer will be an Intel 80486 with UNIX and X Windows.
And plenty of card slots.

So, that kinda leaves Atari and the VaporWare TT/P (for Plastic, sheez what a great name for a computer. A Plastic computer. Oh boy!!) for someone else to buy!!

>
> Now that I've got my own little 68030 worksation (named after a popular

> game. Best of luck in your computer search!
>
> Chris Mauritz

Actually, Chris Mauritz has a valid point that no one at Atari can deny.
That is
DELIVERY
DELIVERY
DELIVERY

Atari announces a product and then Cries "FCC!! FCC!! FCC!!" as if no other computer maker is subjected to testing by the FCC. Only Atari has to be delayed by FCC testing!! So, Atari announces a product and months (or years in the case of the CD ROMS!!) go by and no delivery. And finally when they do deliver it is much less then the announced product. The Mega ST is an example of this. The Blitter is less powerful then it was promised. And even the DMA port isn't buffered, so you can overload it if you use a couple of hard drives and the Atari laser printer. Some robust business computer that Mega turned out to be!!

So, from past experience we can expect a CHEAP 68030 machine from Atari that won't be expandable and will be margin in other aspects.

Godd luck Atari!!

Richard (The Whiner (tm)) Covert

P.S. As much as I am disappointed by the TT and what it implies about Atari I still like my ST better then a Mac. In that regard I like to close my posts with a description of a program that I like about the ST.

This message ends with my endorsement of the WERCS Resource Construction Set marketed by MICHTRON. It is very easy to use to build RSC files for a whole host of langauges. WERCS has a utility to convert DEGAS pictures into icons that can be included in your RSC. WERCS has a TEST mode where you can see if your buttons work. WERCS can convert RSC from other RSC editors. All in all, I find WERCS to be an excellent tool for the ST programmer!!

Hello,
Has anyone ever managed to send a message to a desk accessory in GEM?
It always bombs out whenever I send a message to any but the process that is
sending the message (the ap_id returned by appl_open()).

E.G.

```
:
ap_wid = appl_find("MYACC "); /* This bit works */
gets(message); /* Unimportant */
appl_write(ap_wid,strlen(message),message); /* This crashes */
:
```

However if appl_find is given the name of the current process then this
code works fine.

It is not the desk accessory that is at fault as it works perfectly with system
messages sent by the AES.

Anyone tried anything similar at any time?

Any information would be appreciated, probably replying by e-mail would be
best to avoid boring everyone!

Much appreciated:
Matthew

If you don't manage to get things right by repairing the keyboard,
you can just plug a DEC-Keyboard to the RS232C, and put "Deckey.tos"
into your AUTO folder. It works quite well.

1863. TOS 1.4 AUTO bug

Newsgroup: comp.sys.atari.st
Date: 1989-10-21 00:09:12 UTC
From: fortinp@bcara13.bnr.ca
Message-ID: <122@bnrgate.bnr.ca>
Source record: 248035

Has anyone else experienced the following problem?

I installed TOS1.4 in my Mega 2. After booting up the system
I installed NeoDesk 2.05 and used the new AUTO feature in the
"Install Application" to make NeoDesk auto-start on bootup.

Next, I re-booted my system and NeoDesk auto-started as
expected. I then double-clicked on UniTerm and was greeted
with two bombs. OK, only two changes to my environment:
TOS 1.4 and Install Application AUTO versus using STARTGEM.
I removed the AUTO install feature and re-booted. Then, I
started NeoDesk 2.05 by double-clicking on NEOMASTR.PRG and
got my favorite desktop. Then double-clicked on UniTerm as
before and everything is fine. I repeated all of the above,
and it seems to me that there is a bug in the TOS1.4 AUTO-
start feature.

I also talked to others in our club who have experienced
similar two bomb crashes when using this new "feature".

Atari?

Cheers,
Pierre Fortin

>I can't imagine that the USSR would by ANY computers for their schools within
>the next 5 or 10 years.
>

I agree that it is unlikely that the Soviet Union offers much potential for Atari sales, but for different reasons than Peter gives. I believe the IBM PC class of personal computer has become the accepted standard for personal computing in the USSR. An article in the New York Times business section (Oct. 1, 1989, "Soviet Plant, U.S. Managers") told of a contract awarded to Phoenix Group International, the firm is to build some 12,000 PC AT compatible computers here in the U.S. and will setup an assembly plant in Pensa that will deliver the remainder of a total 6 million computers by 1994. The article said that 3 million computers were slated to go to schools and the other 3 million were to go to factories and offices. The article also mentioned that Siemens A.G. currently has a contract to supply 300,000 personal computers for Soviet schools.

The article went on to say that a PC class machine sells for 30,000 - 50,000 rubles in the USSR and is typically "junk", the new PC's in the Phoenix deal are expected to sell for 100,000 rubles. When asked if such a high price might invite price competition, the article claimed a Soviet official said "What's competition?"

One other interesting note was that the Soviet Union would pay the split in profits from the joint venture to Phoenix Group by providing chemicals, scrap steel, and other goods to Austrian Laenderbank for sale in the West, as a means of generating hard currency. Sheesh, the things 'ya gotta do to make a buck these days. OK, so the article said the deal was worth as much as $8 billion.

> the built-in video modes are nothing to sneeze at.
>

I think exactly the same way! To me, it is very significant that Atari
can really make computers affordable. For example, a ST costs less than
a third of the price of a MAC, at least here in Finland - and THAT is
something to think about...

Where does all the extra money the Apple takes go? You can even emulate
a MAC with a ST faster than a real MAC. I hope (and believe) that the TT
will be the first truly affordable machine for Unix-usage.

It takes no effort to make a good but expensive computer. It is much more
difficult to make a computer that is as good but many times cheaper!
I think that's one of the reasons for why there still are some atarians
on this planet....

1867. GDOS, PP and outline fonts

Newsgroup: comp.sys.atari.st
Date: 1989-10-21 03:01:46 UTC
From: MEGGIN@vm.epas.utoronto.ca
Message-ID: <89Oct20.230647edt.57387@ugw.utcs.utoronto.ca>
Source record: 248039

Actually, there is only one package using outline fonts on the ST, but it's Calamus and not Publishing Partner. PP uses some rather pathetic outline fonts on the printer, but it still uses raster fonts for the screen. Furthermore, Calamus uses real, licensed Compugraphic fonts.

Besides, what's all this about? Apple is still developing its outline font system. Certainly, a Mac can output to a Postscript device which uses outline fonts, but so can an ST or IBM. Right now, Macs use raster fonts just like GDOS, except the output resolution is not as good on the imagewriter (I imagine). The only system I know of with outline fonts is the NeXT, and the __only__ full DTP package with outline screen fonts is still Calamus (Mac users, turn green with envy!!!!!).

>

If you think that the Sysop Program from USR is outstanding, wait til you
take a look at the Dealer Demo Program from USR. It'll blow you off your
feet.

Currently, all USR Courier HSTs shipped are 14400 bps. The 9600 bps HSTs
had been discontinued for some time now.

>
>Your transmission speed depends greatly on the quality of the phone line, but
>1625 cps sounds typical for that modem. You won't get that high on some

>handle data that quickly off of the serial port.
>

Actually, 1625 cps is not typical for the 14.4 HST. The USR manual itself
lists 1740 cps as typical when using HST mode and MNP level 4. Some have
reported on the HST Echo cps ratings as high as 2000.

>That is typical also for Y-modem transfers. The only program that I know of that
>gets >>800 cps for uploads is ST TERM, with its built in Z-modem protocol.
>

I was using Zmodem. That's why I wanted to know if Ymodem-G would improve
on that dismal cps rating. Currently, the best I can get is ~900 cps using
Ymodem while in v.32 mode. Interestingly enough, Zmodem gives me worse
throughput when I use it to upload.

>
>I have had my USR 9600 HST for 6 months and have found that it is very reliable,
>and has paid back it costs via lower phone bills already!! And USR has sent me
>to updates (firmware) to it already for free!! That's good support!!
>
>Rich Covert

It's a good modem, that's for sure. I am trouble by the reports of
incompatibilities though. It seems that the Dual Standard has trouble
connecting to some modems at 2400 bps and even some modems at 9600 bps

(v.32). The frequent firmware updates are troubling also. I bought my modem less than a month ago and I find that my firmware is two or more revisions behind already!

By the way, a small nitpick. The USR Courier HSTs are not 9600 'baud', they're 2400 'baud'. :-)

>
>Next, I re-booted my system and NeoDesk auto-started as

I also have had a problem with the autoboot command. I installed my
Terminal emulation program AnsiGraf to autoboot. However, when I my
computer boots, the program can't access the modem. If I exit the program
and restart it from my hd, it works fine. Also when I exit from the program
after it has autobooted, my desktop comes up in the default colors not the
ones defined in my desktop. I have to call up the control panel from
MultiDesk to reset the colors.

Anything Atari?

On TOS 1.4 incompatibility. It seems that OmniRes will not work with TOS
1.4. Anybody have a new OMNIRES.INF that will work with 1.4.
I have version 3.01, maybe I wasn't informed of an update.

At the risk of seeming picky, I'd like a few things from a company whose president announced the release of new operating system ROMs in front of developers and press at Spring COMDEX. I'd like my dealer (Software Plus, a local Chicago-area chain) to get decent supplies of ROMs. I'd like those ROMs to be honest-to-pete mask programmed ROMs by now, not PROMs or (heaven help us) EPROMs. I'd like to be able to buy a Mega with the new operating system installed as original equipment. That's a fair fraction of what I want from Atari.
Is there any special reason why the TOS 1.4 rollout is going so fitfully? Suggestions that it's going smoothly will be cheerfully laughed at. Suggestions that ROMs always have startup problems this bad will be greeted with incredulity.

1872. Turbo C, Gulam and the stack

Newsgroup: comp.sys.atari.st
Date: 1989-10-21 12:14:21 UTC
From: MEGGIN@vm.epas.utoronto.ca
Message-ID: <89Oct21.081817edt.57405@ugw.utcs.utoronto.ca>
Source record: 248044

Turbo C does use the stack strangely, but you can force a function to use a normal ST stack with the keyword `cdecl' (also found in MSC and TC on the IBM). For example, if you are trying to call Gulam from TC, use a prototype for the function pointer like this:

```
int cdecl (*sysptr)(char * cmdline);
```

Then, whenever you call (*sysptr)(), it will place its argument on the regular stack. Remember to get the value of sysptr from SHELL_P, and that SHELL_P is in protected memory, so you will have to go into supervisor mode to look at it.

1874. TT vs 386 box and flames

Newsgroup: comp.sys.atari.st
Date: 1989-10-21 16:52:26 UTC
From: cmm1@CUNIXA.CC.COLUMBIA.EDU
Message-ID: <CMM.0.88.624991946.cmm1@cunixa.cc.columbia.edu>
Source record: 248046

I logged on this morning to find a pleasant boxful of flames about my previous post. The overwhelming argument was "Gee, why I could buy 2 TT's for the price of one Mac IIcx [nobody touched the subject of my post...the fact that 80386 25mhz machines are comparable in price]...ad nauseum....

Well, sure! That lil' TT will save you tons of money! As a matter of fact, you won't have to spend a dime on it cause you'll probably never see it. Now that's what I call a bargain. Hehe, you could put that 2.5K in the bank and earn interest. (Gee, Atari is actually doing us all a favor...How nice of them :-)) This whole argument for the cheapness aspect of the TT is like saying "Hey, why should I waste my money on a Corvette now, when I hear through the grapevine that Hyundai is working on this new nifty sportscar? Of course, I've never seen one and the company only produces cheap cars now with little or no support. What the hell, sounds like a bargain to me?"

Meanwhile, back at the ranch, JoShmoe can buy a 25mhz 386 box with super VGA, hard disk and all the niceties (yes, even unix) for about 3-3K. AND he can buy it NOW when he needs it. <If you don't actually NEED the power, you might as well wait for the <snicker> TT>.

Chris Mauritz

>on this planet....
>
> Jouni

I originally simply posted an ad I saw for a 25Mhz 386 box, 8 expansion slots, VGA color high res monitor and card, 60 meg 1:1 hard drive, floppy, keyboard, 1meg RAM for $1995.00 ... and correct me if I am wrong, there are several flavors of UNIX to choose from that should indeed run on this machine. I don't understand why people such as Jouni say: " first truly affordable machine for Unix-usage; ... as good but MANY TIMES cheaper..". Does Jouni know something that I don't know? Has ATARI announced a price for the TT? Is it MANY TIMES cheaper than $1995.00 ? WIll ATARI support their Unix SYS V as well as they have supported TOS? Hmm...I guess only ATARI can tell us for sure, and since their lips are sealed, it's hard to read them....

What makes the 386 an industry standard? As far as I know, there are
very few programs especially for it. The more people keep supporting only the
PC-line (XT, AT, 386...), the more technology has to go along the
same traditional tracks.

I have got every program I've needed for my Atari ST this far. Usually they
are more user-friendly than their PC-counterparts. I think it is stupid to
speculate about if the TT is coming or not. They have already introduced
it in Germany. (And if it wouldn't come, Atari could soon be in bankrupt
or something...)

How come that is beyond the power of a TT? For even the ST is NOW
available a graphics card with resolution 1280x1024 with 16 colours from
palette of 262144. And this is not the only one. I doubt a 25MHz 386 is
any faster than a TT.

> Also, the ads

>>
>> Chris Mauritz

Why compare an Apple with 68030 to an ST?!?! Compare a MAC to a ST and
compare their price, too! A ST costs only less than a third of a rival
MAC, at least here in Finland. You can still emulate a MAC with a ST
even faster than a real MAC. Where does all that extra money Apple takes go?

> So, from past experience we can expect a CHEAP 68030 machine from Atari that won't
> be expandable and will be margin in other aspects.
>
How come won't be expandable??? You can even expand a ST very well, even
if it doesn't actually have ANY card slots... By the way, remember MIDI,
too.

I think Atari has done a great job bringing computers affordable. Even
if I should wait for my new computer a bit longer, it's worth the effort
because I can get it many times cheaper than from other manufacturers.
I, for my part, will always support economic technology....

Jouni Alkio

From: brandonl@amadeus.WR.TEK.COM
Message-ID: <490@wrgate.WR.TEK.COM>
Source record: 247851

My desire is to get into music composition, not having any formal training.
I have looked at a few keyboards, and have found the Roland D-5 to be
sufficient for my needs (8 voices plus drums). Now, the hard part.

Realizing the rivalry between Amiga and Atari exists, I ask those of you
with some experience with both machines to help someone to decide the
"best path for my particular needs."

I am aware, also, that both Commodore and Atari will have new machines out
soon. This may be under the category of sci-fi, though.

In any case, I shy away from small systems, like the A500, for future support
reasons, and the fact I will necessarily need large memory (~1 MB RAM to
begin with).

I am afraid, however, that local support of both machines is spotty here
in Portland, Oregon. Sure, there's PC's (dull, number-crunching-intensive
machines), and there's MAC's (too overpriced). Is there an optimum solution?
Money is, of course, an issue. A few grand is ok for a music system, CPU,
a word processor, and a couple games. But for amounts over that, I think I
will simply crawl back into my shell and wait for cheaper times ahead.

Thank you so much.

>would translation of a product give it a great competitive advantage
>over a similar, but non-translated product?

Larger packages, like word some word processors, speard-sheets, integrated packages etc get translated if the market justifies it. Programming languages, programmers editors and special utilities usually don't since professional programmers know english well anyway, and the market is smaller (by comparison). As for DOS itself, IBM translates all DOS documentation, and all text strings in the programs themselves, to Swedish (and all other national languages too). To me it's a nuisance, since I prefer english. It looks so ridiculous in swedish many times, and sometimes the translations aren't right either. So I always try to get the english language versions, but it seems DOS 'in english' is getting hard to find on the swedish market.

In general, I think it's a definite competitive edge here to have docs and prompts in the national language in question.

About the rest of Europe, I know that in France it is regulated *by law* that in order to sell a computer product there, documentation in french *must* be available. I don't know how the law is obeyd - my company does export to France (both hardware and software) with english docs...

As for population sizes for those who don't know, we're about 8 million people here in Sweden, and there are about 55 million in France. Both countries cover approximately the same land area.

>III: Product Introduction
>
>After reading several overseas computer mags, I get the impression that
>(to be sarcastic) Europe is used as a beta-test site for US-developed
>software. I own SPRINT 1.0 which I believe is the most recent version
>available domestically, while users in Europe are using version 1.5.

But is Borland an American company? The original Turbo PASCAL was written by a danish guy (who admittedly now lives in the US). And (I may be very wrong about this but) isn't the company which owns Borland based in Sweden? I think I've seen something like that somewhere (but I think development - most of it - is actually done in the US). Further I know that Swedish Borland International has more or less forbidden US Borland to export to

swedish distributors, since SW Borland wants Borland products in Sweden to have swedish docs. Therefore to get english docs, I had to buy my Turbo C Professional package from abroad (actually from Logicsoft in Holland). Isn't it weird?

But to answer your question, I don't think Europe gets earlier releases than the US. Rather, the introduction of the same packages are probably done at the same time, or maybe somewhat later here.

From: SML108@PSUVM.BITNET
Message-ID: <89294.201800SML108@PSUVM.BITNET>
Source record: 247853

Hello out there once again, I have been working on a video game which reads the joystick port via event reporting. It seems to work just fine, but occasionall y, mving and holding the joystick causes a series of keyclick noises as if I was holding down a key, and in fact, Bconin will detect keyclicks at the same time (repetitive for as long as I hold the joystick in whatever position it was in when it started making the keyclick noises)
This does not occur on a friend's 1040ST. Here comes the big question (Anyone at Atari listening): My keyboard was replaced several months back before I started working on this game, it was originally a C070240-011, and is now a C070075-011. Could this somehow have a slight compatiblity problem with my computer which would only manifest itself at VERY odd times ?
This problem also occurs when I play the game Falcon.....

>outline screen fonts is still Calamus (Mac users, turn green with
>envy!!!!!).
> David Megginson, Centre for Medieval Studies, Toronto

The big advantage that the Mac has over the ST that could be corrected by outline screen and printer fonts is that the Mac can load and unload fonts as needed because of its automatically ejecting floppies (Insert System Disk). The ST loads all of its fonts when a program asks for them, but if you need to check fonts sizes on the printer fonts, you have to load evey one of them into memory. In addition, the Mac uses the same bitmapped fonts (albeit in different sizes) to do printer output so you don't have two different 12 point fonts stored in memory.

Imagine how mnay Imagine how many fonts you could load if you just needed one outline for each typeface! Even with a large cache, we'd win.

If anyone knows what the Mac does in better detail, feel free to correct me.

> and since their lips are sealed, it's hard to read them....
>
The price comparisons I've are between the Apples and Ataris because
they are very much same technology. I admit that such a 386-system is
quite cheap.

Atari HAS announced a price for the TT in Germany: 6500DM for a TT with
a 30MB hard-disk and a monochrome VGA-monitor and 2 MB RAM.

I have also read that Atari would announce a TTP in England - cost: 1300
pounds with 1280x960monitor and a 60MEG hard-disk. (This is not as sure
as the German information, though.)

I have also read that atari would announce a version of Unix for about
300 dollars.

I know that Atari supports Europe more than the US. I can imagine why...

1887. Spectre GCR and Teac Drives

Newsgroup: comp.sys.atari.st
Date: 1989-10-22 15:46:06 UTC
From: synth@NCoast.ORG
Message-ID: <1989Oct22.154606.895@NCoast.ORG>
Source record: 247859

Does anyone know if the Spectre GCR will work with modified-to-run-on-the-ST Teac disk drives? I have my doubts, because I could not get the Discovery Cartridge, which appears to modify the drive speed in a similar manner as the GCR, to work with my Teac drive. If it doesn't work, is there a way to fix things so it does?

-Steve

1888. SPECTRE GCR: it's heeeerrrreee....

Newsgroup: comp.sys.atari.st
Date: 1989-10-22 16:56:24 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891022.10562398.008900@SFA.CP6>
Source record: 247860

An unexpected joy arrived at my location this week, the Spectre GCR.
And yes...it is all as advertised and talked about. Sound works GREAT,
and the floppy access on real Mac disks is ok, particularly in speed.
Indeed, one MACer friend on mine said that the floppy access is faster
on the GCR than it is on his SE. Overenthusiasm? Nope, it really is.
Improvements over the Spectre 128 from the "Dumb Joe End User" point
of view: Ability to run System 6.03, actual usable sound via SoundMaster,
Mac floppy use, right mouse button (used as a shift key) use, Turbo Disk
Mode. Of course there are scads of bug fixes and other things that
are largely unseen to Joe End User.
Turbo Disk Mode needs to be mentioned. For those of us using that
awful Seagate 296n hard drive mechanism, this is a real plus. The 296n
is respectively fast, in spite of its ROM bug that chokes it, but in
order to use it with the Spectre, it sometimes needs to go into slow
SCSI mode as determined by Spectre's setup menu. Although Dave says
that slow SCSI is not THAT slow, it is noticeable to me. Idiot that I
am, I like to keep things pushed til they fry.
Page 133 of the manual shows a listing of the special function keys
that include access to the Turbo Disk Mode. With this mode, one can
turn it on and off at will. For those of you not experiencing the lovely
problem of the 296n, what happens is that you will be informed that a
file can either not be read or written to. With Turbo Disk Mode, all
will be right with the world. It is quite rare, at least for me, for
the problem to creep up.
Mac floppy access needs to be mentioned also. As most on the net
know, this poor Mega2 of mine has been fried many times due to everything
from lightning crashes to 'lord only knows what'. Shame that I didn't
take advantage of the old exchange rate that Atari had on their equipment.
Shame on Atari! Their prices were the main reason that I elected to go
with Atari rather than Apple.
Anyway, my Mega floppy reads Mac disks just fine. It is a known fact
that my floppy mechanism is all but brain dead. But, it still reads the
Mac floppies! Insert a Mac disk in, ANY Mac disk, whether it is direct
from Apple or from a real Mac. On my Mega, it takes two passes (about
a total of three seconds is consumed) and then I'm reading Mac files.
Once the directory is up, then access is instantaneous and FAST! The only
problem that I'm encountering is my ability to write to a Mac disk. My
near brain dead floppy drive just doesn't like that, in spite of an adjustment
included on the GCR. For me, at least for now, this is a minor problem.
Reading the disks are mainly what I need.
Ah, two other features need to be mentioned: LAUNCH.PRG and
the new TRANSVERTER. LAUNCH.PRG allows you to literally /AUTO/ launch
Spectre without your having to go through the Spectre utility program.
LAUNCH reads the configuration file and shoots you directly into "Mac"

mode. Slick, eh?
TRANSVERTER is improved, allowing direct reads of Mac floppies (MFS only) and increased partition number access--a big plus.
IMpressed? You betcha! If you are still waiting on Spectre GCR, hang in there...it is on the way. Spectre GCR is an incredible product and an incredible improvement over Spectre 128. EVEN THE MANUAL IS GREAT--YEP, IT IS IMPROVED.

Source record: 247861

cmm1@CUNIXA.CC.COLUMBIA.EDU (Christopher M Mauritz) writes:
Well, unless you are a diehard Atari fan (I know, there are still a few
left), I would advise you to buy the 25mhz 386 now (if you do indeed
need it now). Besides, if you want to use it for work you would be
much better off with an industry standard 386 rather than the TT (if it
ever does hit the market). The 68030 is such a nice mpu compared
to the Intel mpu's.

That's for certain. The context is much nicer!

[...]
Besides, who needs another workstation with non-industry
standard 16 bit slots.

Got that right.

<1049@cc.helsinki.fi> JALKIO@cc.helsinki.fi
(Varsinainen sikapossu kuoli t{n{{n.) responds:
What makes the 386 an industry standard? As far as I know, there are
very few programs especially for it. The more people keep supporting only
the PC-line (XT, AT, 386...), the more technology has to go along the
same traditional tracks.

I don't know about Finland, but here there are more PC's on desktops for the
small business and home user than loose paperclips :-). Seriously, the
amount of PC's abound is sickening. If it's not an industry standard,
tell me what is. Besides, you said more people supporting one line,
the more technology has to go along the same tracks ... doesn't this
sound like industry standardization?

(Varsinainen sikapossu kuoli t{n{{n.) continues:
I have got every program I've needed for my Atari ST this far. Usually
they are more user-friendly than their PC-counterparts. I think it is stupid
to speculate about if the TT is coming or not. They have already introduced
it in Germany. (And if it wouldn't come, Atari could soon be in bankrupt
or something...)

I also have just about every program I've needed for my Atari ST, too.
Almost every. There are things for our SUNs that I wouldn't mind having,
but my biggest hang up is the fact that the same programs available on
other machines are so much more powerful, nicer, AVAILABLE, and supported.

If Atari's listening, Varsinainen's made a good point within parentheses
above. I'm not sure if bankrupt is the word. Maybe lynched by its user
base (excluding the fanatics).

Richard Covert writes:
Not only are 80386 PC computers available there have been some really great prices in misc.forsale for 25 MHZ 80386 computers with 1024 x 768 x 16colors color graphics. something beyond the power of a TT, I believe.

(Varsinainen sikapossu kuoli t{n{{n.) responds:
How come that is beyond the power of a TT? For even the ST is NOW available a graphics card with resolution 1280x1024 with 16 colours from palette of 262144. And this is not the only one. I doubt a 25MHz 386 is any faster than a TT.

Or just get a SUN 3/260 or a Sparcstation, a blow both away. Much more expensive, true. But SunOS UNIX is truly superb. Also, I know of a few 25MHz 386's that could beat a TT.

Richard Covert continues:
Also, the ads
I have seen indicate that the 80386 PCs have 32 bit, 16 bit, and 8 bit motherboard busses, so can use a whole spectrum of IBM PC plugin boards (things like hard disk on a card, internal modems, additional serial i/o, eprom burners, geez just all sorts of things that Atari customers are too cheap to want to buy!!).

To which Varsiinainen replies:
What's so important in having INTERNAL modems, etc... You can buy all off those devices for ST's and TT's, too.

Just take a look at my desk, and you'll see the advantage of INTERNAL stuff. I've got my 1040 sitting on it. A huge cable comes out for my external disk drive, which is also propped up vertically against the wall behind the desk; I've got another cable coming out to the Atari EXTERNAL harddrive that's too big for 20 Meg, and sounds like a 747 during takeoff. Then I've got another cable coming out to my EXTERNAL modem. And, finally, cables going out to my printer and my two monitors. It's a mess! If my 1040 were more like a Mega (which is also too small), and if I could put the harddrive, diskdrive, and modem all inside it on CARDS, I'd just have to worry about hiding the cable for the printer---and that's easy by just throwing it behind the bloody CPU box with its nice INTERNAL cards.

Covert continues:
So, that kinda leaves Atari and the VaporWare TT/P (for Plastic, sheez what a great name for a computer. A Plastic computer. Oh boy!!) for someone else to buy!!

To which Varsinainen replies:
Can't you make up better arguments that ones that are based on a computer's name?

Richard is not saying the the name of the bloody thing is something that should be taken into account. He's merely making an editorial comment about Atari's choice to call the TT/P the `Plastic.' I agree with him:
Oh boy! A Plastic computer!

Chris writes:
Now that I've got my own little 68030 worksation (named after a popular red fruit <grin>) and have it actually in front of me (yes, you can actually see and touch it!).

Varsinainen says:
Why compare an Apple with 68030 to an ST?!?! Compare a MAC to a ST and compare their price, too! A ST costs only less than a third of a rival MAC, at least here in Finland. You can still emulate a MAC with a ST even faster than a real MAC. Where does all that extra money Apple takes go?

Chris is not comparing an Apple II to an ST. In fact, I don't know of any Apple II that has a 68030. He OBVIOUSLY means his Mac. Get a clue :-)
And my ST can NEVER beat the nearby Mac II in terms of speed or graphics.

Richard says:
So, from past experience we can expect a CHEAP 68030 machine from Atari that won't be expandable and will be margin in other aspects.

Sounds right. When I was still a fanatic, I was convinced that the Atari was the most powerful computer out for the price. For only a few hundred dollars more (I had the money) I could have gotten (ack) an Amiga (oh no!). Or something that has support. Dare I say it? Yes, a Mac.

Varsinainen replies:
How come won't be expandable??? You can even expand a ST very well, even if it doesn't actually have ANY card slots... By the way, remember MIDI, too.

Sure I guess you can expand an ST `very well,' but it isn't easy. You just don't lift the cover a drop in a card. You lift the cover, desolder a chip, patch a jumper, solder a socket, pay through the nose for parts, and labor if you don't know how.

I remember MIDI. That's about the only thing Atari's got going for the ST line.

I avoid Intel like the plague, but my next Motorola box will NOT be Atari.

Yes, the ST's are inexpensive. That's great. If you want it now, though, forget it. And support? I've sent out all the warranty cards I could from my Atari stuff, and I've never gotten a single brochure from Atari, or a newsletter, or anything. I wonder if there's anybody back there. Authorized repair centers? We don't need no stinking authorized repair centers!

Just remember:

(Power Without the Price) = (You Get What You Pay For)

Dear Pals,

I have recently been using my beloved atari as a terminal, with Uniterm v2.0c, to enter a C program which happens to need the word OBSERVER fairly often. I noticed that if I type <shift>S <shift><anything else> too fast, Uniterm runs the string I have assigned to F1, which is my dial-up routine for the Cluster here. Has anyone else noticed this bizarre sort of behaviour?

Jan Ameij,
Oxford University Department of Applied Metaphysics,
ameij@uk.ac.oxford.vax

PS Occasionally Uniterm blats into help screen with the menu for "transfer" dangling down and no cursor, and needs a reboot. Anyone met this?

PPS I still think Uniterm is the best terminal program I have seen, and I include the ROM's in DEC VT340's

I think that this argument regarding what machine is better is going nowhere. It seems that some people like their computer the same way they like their children: blindly. There is no question that you get more crunch for your money in the IBM world NOW. You can pick up a 12Mhz AT compatible with a 30Mb hard disk for $1200. You can also get the famous hot 386 box for under $2000. Atari prices just aren't what they used to be. The world changes. I don't program the way I used to. Now, instead of assembler, I use C. If I want to have fun, I use LISP. Let me tell you that I have the nicest ST lisp in the world and does not hold a candle to PC-Scheme. Therefore, for me, (* I am not saying for everyone *) a hot PC is a better machine. This was not the case a few years ago.

If you feel that you must uphold the Atari name, please go to your nearest Tramiel temple (i.e. Atari dealer) and give a donation.

Andres

P.S. If the famed TT does beat the price/performance of the 386 box *and* I can get good software support for it, I am willing to eat my words, but until then, let me propose you look at the facts.

I got one at the WAACE event for $29.
There was another for $35.

reason: no instructions.

no problem... the first one I bought came with instructions..

ps: I didn't get the second one because I was too overwhelmed with
``I WANT EVERYTHING!'' so I spread my money as best as I could.

pps: I just saw a hard drive for $80 on the net... THAT got my attention!

Floppies? (shudder...) You mean automatically jamming floppies, don't you?
It's *so* much fun digging a floppy out of a Macintosh with a paper clip.

> Imagine how mnay Imagine how many fonts you could load if you just needed one
> outline for each typeface! Even with a large cache, we'd win.

As David pointed out, the ST already has an excellent publishing system
with outline fonts.

It would be great if Ditek (the folks who publish Calamus worldwide) would
spin off the screen/font management system as a module that could be
employed by other programs.

By the way, whatever happened to the desktop publishing program Atari
Corp. was supposed to be developing using Deskset and Compugraphic
technology? I've seen sample output, but I've never seen an announcement
of availability.

Source record: 247875

I was talking to my dealer (one of the largest in Canada) and he informed me that Atari Canada was waiting for the "new version" of Tos 1.4 to come in. As I was certain that Atari had said that there was only one version of Tos 1.4 (other than developer disk version?) I queried him further. He assured me that they were waiting for a new version of Tos 1.4?? Does anyone know anything about this? What were the changes, or am I, and my dealer mistaken?

What I find annoying is that ROMs that fix bugs in the operating system that was promised years ago is costing me $100. Surely Atari could afford to foster some loyalty by offering a "nominal" trade in price for ROMs. The mac os is essentially free (you can buy an official disk for $45) and I wonder how the copywrite would affect TOS. Are updates to TOS separately copywrited? If I own a copy of TOS 1.0, am I legally entitled to make an updated copy to 1.4?

Source record: 247878

On the subject of all this TT controversy, I've finally decided to add my 12 1/2 cents. Yeah Atari has been a glorious band of idiots ever since the 1040ST but even if it takes them another 6 months to get it out, the TT is an INCREDIBLE machine for the price. A comparably equipped 68030 Amiga will run you $4500 (Hint, buy a a MAC II for $500 more with hard drive). I am very disappointed in its graphic capabilities, but sheesh, the base computer will onyl be around $1500. This guarantees its survival as this is just as incredible as the ST when it came out. Even with Commodore's huge advertising blitz, the junkola Amiga 500 with 512K of memory is being pushed for $100 less than a 1040ST with monitor. I know what I'd buy.... Now before I get Commodore flamed, I LIKE THE AMIGA ! However, the 500 is garbage, the 520ST of the Amiga line, only slightly worse (I use a 2000 myself). Oh well, I have spoken my bit.....

I forgot who said that the TT was "available," but I could not help but snicker. I think the poor fellow mentioned something about the machine being shown at some show and the users raved about it, etc...ad nauseum. As I recall, the Atari CD ROM player was also shown to a wide-eyed and bushy-tailed group of enthusiasts SEVERAL YEARS AGO and where is it today? When the product is in a store where I can see/touch/buy (HAH!) it, then it is available. Until then it is vapor hype. Sure any clever fellow with a bit of money and some brains can put together a couple of nifty prototypes and show them around and brag, but production is another matter all together. I think Atari has shown their bungling ways long enough. Some people will just have to get hit over the head with a 520ST power supply before they see the light.

It is worth noting, however, that Atari DID produce a nifty little MS-DOS (albeit DOS 2.1) box for PeeCee lovers and you CAN ACTUALLY purchase it. AND they did produce a nifty little handheld vieo game. Just goes to show you where their priorities lie. Hell, if there is more money to be made by making little gadgets instead of computers then why waste their time on the ST at all? It is/was a great computer, but the lack of support and lagging development has been dragging the ST line to the technological basement. Ahhh, but I still like it for Air Warrior. :-) Now, off into my ME262 I go. Wheeee!

So much for flames to /dev/null. Listen, do you remember when earlier this year, and Atari spokesman said, "Ok, we're going to do a better job this time." Since then, they have announced:

1) The Porfolio. Shipping in the US.
2) The Stacy. Shipping in Europe.
3) The PC4. Shipping in europe? Samples in the US?
4) The ATW. Shipping in europe? Samples in the US?
5) The TT.
6) The STE.
7) The Lynx.

Sounds like they have been doing a better job than in the past. Tell you what, why don't we postpone this discussion for 4 months. If, at that point, Atari hasn't delivered the TT or STE or Lynx, then flame them for it once. Then shut up.

We'll all be much happier.

>speed of processing is not the only determinant of productivity!

I think it's finally sinking in to the big micro computer software developers that there is much to be said for standards and regular interfaces. Programs should be written to act alike. Unfortunately, this did not happened in the MS-DOS world since there were no written standards for user interfaces. This is where Apple had an edge. It's not that the programs were intrinsically easy to use; it's just that for the most part, the programs all seemed to be born of the same mother and acted similarly. Unix users see this too. Even though unix is supposed to be a user hostile environment, there are some de-facto standards regarding command line args and key bindings that make using the programs fairly easy to remember.

More, on a divergent topic:
The only nice looking interface environment for micros is the Mac's. All others are ugly poseurs. The thing that gets my goat is that for very little money (~$10000) Atari, Commodore, and Microsoft could all have had beautiful graphics and nice fonts for their windowing environments.

Now you (John/Jane Q. Tightcode) might be saying "the graphics aren't as important as the speed." Well, I have some news for you: you are wrong. The graphics are the user's view of the machine. They determine how valuable the machine is to the user. I don't doubt that the Mac's good looks make user think that the $2K she/he just threw down for a Plus was actually worth it. (We can laugh at how much Mac buyers are overcharged, but the buyers are satisfied. If there are luxury cars, why not luxury computers.)

>run on this machine. I don't understand why people such as Jouni
>say: " first truly affordable machine for Unix-usage; ... as good
>but MANY TIMES cheaper..". Does Jouni know something that I don't
>know? [...]

OK, so a 25 MHz 386 box comes at $1995.00 (in the US, i guess). But it
is probably delivered with MS-DOS, for that price. Is it MS-DOS 3.x or
MS-DOS 4.x? Most certainly it won't be OS/2. And even more certainly it
won't be a UNIX system.

So the question arises: How much is SCO Xenix in the US? How much do you
have to pay for SCO UNIX (who wants SCO Xenix if they can have SCO Unix).
Does Microport still sell and how much do you have to pay for that? And
how about those Unixes as far as X-Windows is concerned?

However, since the prices for the TT with Unix and X-Windows isn't known
yet, how can you truly compare?

Conclusion: If you need POWER WITHOUT THE PRICE NOW, look for a 386 box
but don't expect to get a cheap Unix system out of it. If you need POWER
regardless of price then go for a workstation typt thing with Unix and
maybe X-Windows. If you can wait, then you might as well see what a TT
with Unix and X windows costs and what performance it yields.

Martin

>
>It's clear that European paper sizes are different than in the US.
>However, what about popular computer printers: do they tend to
>(at least by default) print pages of 66 lines by 80 columns?
>
Depends how you define popular. Most 'home-level' printers I've seen
default to 8-1/2x11 (US size) paper (or 9-1/2x11 counting the tractor
strips. This size paper also tends to be cheaper. Some people, like
me, find it annoying.

'Serious use' printers tend to (at least switch selectably) default to
A4, as that is the customary size for business correspondence, binders,
etc. A4 is really sized in metric, but as a near-enough approximation
A4 computer paper is 8-1/4x11-2/3 inches. The 11-2/3 is slightly wrong
for A4, but means that the paper works neatly in a printer with a 6 lpi
line throw. 80 columns wide is good enough (anyone who really needs
more margin will handle that when they format things) but 66 lines is
wrong -- A4 is 70 lines long.

Again because of the split market, A4 tractor paper is more expensive
than US size in the UK. A lot of this, though is because A4 is only
easily available in high-grade 'letter quality' paper, while 8-1/2x11
is available in junk 'listings' grade. Still, if you are going to do
any serious business- oriented software, WPs, etc, you've got to cater
for A4. It's painfully tedious otherwise. But, you have to leave in
8-1/2x11 support as well, for the low-budget users.

>II: Software Documentation & Orthography
>
>How does documentation differ in Europe? Do US software developers go
>to the trouble of converting to British spelling? Do British users
>resent it when they don't? Or perhaps the users don't care?
>
US developers don't normally seem to convert the docs. Since I'm bilingual,
(US and UK :-) I tend not to care too much. Just be careful to keep the
doc and the program consistent. Don't change the doc to talk about your
'COLOUR' command in BASIC if the BASIC interpreter still insists on your
using 'COLOR'.

More importantly is to be consistent. What's REALLY annoying is docs (or software) which SOMETIMES use British spelling and sometimes US. Then you never know where you are.

>Note that I'm talking only about the documentation. It's clear that
>(for example) a spelling checker would have to be converted to British
>orthography.
>
Do note, though, that it should be CONVERTED. A lot of companies simply ADD British spellings to their US dictionary. That seriously compromises their usefulness, as the US spellings, most of which are WRONG in the UK, get left in and accepted.

>Is there a big market for third-party native-language software
>documentation?
>
Yes, for complicated packages e.g. Lotus 1-2-3, WordPerfect, Word, etc. Mostly for 3rd-party stuff designed to explain them to non-computer folk.

Both the Atari ST and the Amiga are fine for MIDI processing, but I would recommend the Atari and heres why:

1) Built in MIDI ports.
2) Price (1040st,mono monitor = @800.00)
3) Software Availability- There is a LOT of music software available for the ST. I don't think this is true for the Amiga. I know that there has been more and more stuff appearing for the Amiga lately, but there isn't near as much music software available for it as for the ST.

Message-ID: <8910240704.AA05589@ucbvax.Berkeley.EDU>
Source record: 247891

One netter replies:

>You talk about the limitations of PC's, but you really mean those of MS-DOS.
>There are ways of making a 386 PC very useful; installing MS-DOS on it
>is not one of them.

Unfortunately, most users are not like netters and have enough trouble dealing with DOS never mind systems like UNIX (one local 'expert' spent 3 days installing UNIX on his 386, what chance does the average basic user have?). In addition, MOST software for PCs runs under DOS and UNIX users use bridges to run DOS codes.

Netters, do not lose sight of the fact that you do not represent the majority of computer users who (i) are intimidated by PCs (ii) cannot cope with DOS and (iii) do not stand a chance in hell with UNIX. Telling the minimally skilled user how to run one application is an uphill battle - telling him how to move data across unrelated applications on a PC is a major challenge, and asking him to handle UNIX on his own is not worth the effort.

ya, this is actually easier than you most people think. simply use some sort of desktop.inf editor (ie: QUIKINF.PRG, a fine Quick Utility) to edit the installed applications for your machine. simply pick your favorite text editor as the installed application, and set the application mask to be what ever document you want to look at: ie: if you want to look at all *.C *.H, *.DOC and *.TXT files using TEMPUS.PRG, simply install tempus.PRG as the installed application and for each installation give it one the above search masks. once you re-install that desktop.inf file (ie: reboot, or exit from QUIKINF.PRG), you can then click on any *.DOC file (or any of the masks you set up in the desktop.inf file) and TEMPUS.PRG will automatically come up with the file loaded for you. simple, eh!!!

1921. Mac vs ST prices

Newsgroup: comp.sys.atari.st
Date: 1989-10-23 14:21:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8910240704.AA05597@ucbvax.Berkeley.EDU>
Source record: 247893

I have an 1040 at work and a Mega 2 at home. I also have been using Spectre GCR for a month. Recently, two new employees joined my work group and they asked for recommendations on micros to buy. After I gave them the following:

```
System 1 System 2
-------- --------
Mega 2 + SM124 Mac SE with 4 meg RAM
- 720K floppy - 1.4 Meg floppy (reads DOS disks)
- 60 meg HD - 40 meg HD
- Spectre GCR - Appletalk
-------------- ----------------
CDN $4150 CDN $4500
```

the only recommendation possible was go with the Mac; the ST + GCR has absolutely no price advantage to speak of (STACY + GCR however, has a big price advantage over the Mac portable).

The Mega 2 costs $800 more than a 1040, the Mega 4 costs almost $1500 more. That's a $700 premium for 2 megs (the 1 -> 4 meg upgrade for the SE is $400)

I have quoted corporate prices which are VERY agressive for the Mac. I do not know how street prices compare.

Without Appletalk and with little or no price difference (even without GCR factored in) the ST is hard to sell to management here. Only the ST's very large price difference from the Mac (in the past) got STs in the door. Now, the door is closing as Mac pricing is dropped. I can buy a 1 meg Mac Plus for $1285 and upgrade it to 4 megs for a total cost of $1685. A Mega 4 would cost me about $700 more! Yikes!

I love my ST but the Mac option sure looks good.

1922. Re: Sound Digitizer for the ST (need recommandation)

Taken from Z*net newswire, August 1989...

"Atari Newswire Update

Press release from Atari: To all Atari Owners:

....

Premiering at the Dusseldorf Atari Fair, the TT, with the Motorola MC68030 processor, moves the ST family into the 32 bit realm, achieving a significant increase in computing power with full TOS compatibility. Our goal for the TT was to design an expandable computer that would combine ST compatibility with superior resolution, more computing power, and improved sound generating abilities. At the heart of the TT is a 16MHz MC68030 processor, which allows a high degree of 68000 compatability, while operating at a higher clock speed and providing streamlined internal operations which make it even faster. The 68030 has built in 256 byte instruction and data caches, and an internal Memory Management Unit. Next to it on the board is a socket for an optional math coprocessor (MC68881/MC68882). Memory on the TT is a full 32 bits wide, both the ST RAM which is shared by the video logic, and TT RAM which is not shared. These factors combine to result in a memory bandwidth that is four times greater and program execution speeds up to 17 times faster than on the ST.

In both hardware and software, the TT is compatible with the ST. All hard-ware registers are in the same location as they are on the ST. The ST video modes work the same way on both TT and ST, because they are organized in memory the same way on both machines. Most important for ST compatability is the operating system in the TT: TOS. With TOS as the TT operating system, existing programs can automatically use the improved resolutions of the new video modes, as well as the larger colour palette, without any changing of the software. All this ST compatability has the obvious benefit of allowing TT owners to take advantage of the large and growing base of ST software.

In addition to the three ST video modes, the TT has two new colour video modes available on it VGA monitor: 640 horizontal by 480 vertical resolution with 16 colours, 320 horizontal by 480 vertical with 256 colours. With a high resolution monochrome monitor, a 1280 by 960 monochrome mode is available. All the colour modes use a new, expanded 4096 colour palette which is also available in the ST modes. Even ST monochrome (640x400) is actually a two colour mode on TT; we call it "duochrome."

The improved sound system uses stereo 8-bit PCM (Pulse Code Modulation). This allows the TT to function as a digital tape player. The hardware also includes an automatic variable low pass filter, a stereo balance control and bass and treble tone controls. This sound is mixed through the internal

speaker as well as being output via two RCA phono jacks located on the back of the machine. These features, combined with the high powered computing capbilities of the 16 MHz 68030 allow the TT to produce a wide range of high quality sounds. In keeping with the design goal of expandability, the TT has all of the ports familiar from the ST: MIDI, parallel, serial, and the Atari ACSI DMA port (for Atari hard disks, laser printers or CD-ROM). The TT also includes a 25 pin SCSI port. One of the four TT serial ports can be configured as an industry standard medium speed SDLC network port. Of course, the machine also provides an internal speaker, a clock with battery backup, and a Mega ST compatible keyboard with ports for mouse and joystick.

In addition to the expansion capabilities provided by the TT's external interfaces, the TT is expandable internally as well. The housing can hold an internal hard disk and add-in memory cards. These memory cards allow the standard 2 megabyte TT to be expanded to 8 megabytes, or as much as 26 megabytes when 4 Mbit DRAM chips become avaliable.

Another example of internal expandability is the slot for a single standard "Eurocard" style VME card. This slot allows use of any of the large number of existing VME expansion cards. Some of the VME expansion options currently available include memory expansion, Earthnet and other network boards, coprocessors, graphics boards, and data aquisition (A/D and D/A converters). Already planned for TT VME expansion are an Earthnet board for networking, I/O port expansion, and graphic extensions.

The work-station like capabilities of the TT will be complemented by an optional industry standard operating system. UNIX system V is being ported for the TT. Also available will be X windows as well as an X windows based graphic user interface, giving TT owners all the benefit of UNIX without all of the difficulties usually encountered. Here is a listing of TT specifications:

+ ST compatible operating system, giving TT an extensive software library

+ ST compatible hardware, including all ST interface ports

+ Three new graphics modes: 1280 x 640 pixels high resolution monochrome, 640 x 480 pixels with 16 colours, and 320 x 480 pixels with 256 colours

+ All colour graphics modes use an expanded 4096 colour palette

+ 16 MHz Motorola MC 68030 processor

+ Socket for optional MC68881/MC68882 math coprocessor

+ DMA with built in SCSI and ASCI ports

+ Two serial ports, expandable to four ports

+ Parallel interface

+ Detachable keyboard + Internal "Eurocard" VME socket (A24/D16)

+ Internal hard disk option

+ 8 bit stereo PCM sound

+ 2 Mbytes RAM, expandable to 8 Mbytes (26 Mbytes with 4 Mb DRAM)

+ Real time clock with battery backup

+ Network capable hardware

The Atari TT continues the Atari tradition of delivering Power Without The Price! We reserve the right to change technical specifications without notice. UNIX is a registered trademark of AT&T.

From article <3962.2541c37a@uwovax.uwo.ca>, by 4224_5132@uwovax.uwo.ca (Andrew Semple):
> I have no idea why you think the TT is 'vapourware'. Didn't you see the
> article in Z*net on how everyone who saw it in England loved it. I mean
> there was one right in front of them!
>

Sad, to say, seeing a machine at a show doesn't mean it's going to be purchasable in the near future! The Atari CD-ROM drive was not only shown in 1987, it made the front cover of the UK's leading personal computer magazine (Personal Computer World, December 1987 - I kept the review to chuckle over every few months). The CD-ROM drive, to my knowledge, is still not being sold in the UK - certainly I've not seen any adverts for it in any ST magazine. (I did hear that some were on sale in Germany, but I can't confirm that. Anyone?)

Now, my guess is that the TT WILL be marketed in the not too distant future, but that doesn't necessarily follow from its being shown at a computer exhibition. (Just to emphasise the point, at the PC Show this year, Atari were again showing Hyperchart, a presentation graphics program that's a port of Davrelle graphics for the PC. I first saw this at a show in June 88. The rep from the company that wrote the program, Soft Image Systems, said the port was finished a year ago, but Atari UK, who have the marketing rights, have been procrastinating.)

Me, I'd settle for TOS 1.4 ROMs at the moment. Atari UK is still not shipping them to dealers and ordinary users. At the PC Show at the end of September I showed Atari UK's Bob Katz the postings by Ken Badertscher about availability, and got the nice reply, "Ken works in R&D, and the difference between R&D and reality is at least four months."

Bob K did say the TT would start shipping here about the end of November. Maybe. I'd love to see it happen, just as I'd love to see the Stacy in the shops before Christmas.

I managed to crash (= freeze) the TT on show by going into low-res, opening the 'about..' dialog box to see the 'rainbow' effect and moving the mouse. Hope that one gets fixed by release time!

1925. Life with Atari

Newsgroup: comp.sys.atari.st
Date: 1989-10-23 15:13:44 UTC
From: 4224_5132@uwovax.uwo.ca
Message-ID: <3970.2542f26a@uwovax.uwo.ca>
Source record: 247897

This letter was a response to a fellow with whom I discussed Atari's (mis)fortunes. I think I'll post it.

I, as anyone, will admit that Atari has had some lame ducks that stayed on the development shelf gathering dust. But based on the prior three years track record, I am willing to believe that Atari R&D has their act together. I remember when the 520 was announced. I had my reservations, that computer meant that Atari had to drop an entire train of thought. No more 8 bit. Just 16 bit. I was amazed when it came out. Then the 1040. Then the Mega line, a real jump. Then the (cheap, good quality) laser printer. Then the transputer (an AFFORDABLE parrallel prcessing unit for END-USER's). Porfolio and STacy following soon. Now there is a Transputer workstation. It goes on and on, all the while, spurring companies like Wordperfect Corp. and others to support it. Atari has had no easy task over the last three to five years, I think they have done pretty well. It is time we get over the stigma of Atari being a 'neophyte' company. They seem to be holding their own, progressing. Doesn't every company have it's own white elephants? Don't you know anyone who owns an Apple Lisa?.....

** 2nd Call **

Does anyone know the format the HP Deskjet printer uses for it's
softfonts ?? Neither the user manual of the printer, nor the info
on the 128 KRAM module you need for using softfonts gives enough
info to write my own downloader, and fonteditor on the atari.

HP does supply a software package, but thats's intended to run under
MS-DOS, and i am not using PC ditto.

Hope someone can help me.

1927. Running an ST with SPECTRE over AppleTalk

Newsgroup: comp.sys.atari.st
Date: 1989-10-23 16:44:20 UTC
From: BHOLMES@WAYNEST1.BITNET
Message-ID: <8910240703.AA05472@ucbvax.Berkeley.EDU>
Source record: 247899

You might try using ASYC-Appletalk to connect an ST to Apple-talk.
This requires a dedicated Mac with modem and an ST with modem
and Spectre. I believe you can get it from MACSERVE@PUCC
I've never tried it, but I think it should work since it only
uses the modem port to connect the calling machine into apple-talk.

1928. Autostarting NeoDesk, Spectre GCR, STuff (long)

Newsgroup: comp.sys.atari.st
Date: 1989-10-23 16:44:20 UTC
From: steveg@SPARTA.COM
Message-ID: <8910231644.AA08476@Heisenberg.sparta.com>
Source record: 247900

I think the problem people are having with running NeoDesk as an autorun program under TOS 1.4 is desk accessory related. One user mentioned MultiDesk as part of his configuration. I too use MultiDesk, and know for a fact that it can present problems with an autorun NeoDesk. What you need to do is use STARTPRG.PRG (look in the EXTRAS folder on your NeoDesk distribution disk). This program looks for and (makes use of) extra information in the STARTGEM.INF file (STARTGEM is NOT used). Essentially, STARTPRG.PRG waits for all desk accessories to initialize (like MultiDesk loading in other .ACCs., etc.) and then fires up NeoDesk.

The only problem I've had with this is with SuperBoot 5.5 (an excellent sharware autofolder/acc/gdos/etc orginazation program) in that it's tied to using STARTGEM for autorun programs. Even with all STARTGEM entries for function keys and the defaults set empty, it ALWAYS creates a new STARTGEM.INF file on bootup. The solution is to make your STARTGEM.INF file (with necessary STARTPRG info) READ ONLY. This prevents SuperBoot from writing over it. Unfortunately, this means you can no longer dynamically choose your autoboot program, though you could probably edit STARTPRG to change the name of it's INF file and then use SuperBoot's "other file" facility.

While I'm rambling on, I'd like to mention that I too received my Spectre GCR recently. Everything works fine with one exception - I am having a little trouble WRITING to Mac disks, but I haven't tried adjusting the thing yet either. Interesting though, my "known good" Mac disk they provided me with for intial testing was damaged - 3 real Macs also could NOT read a file on the disk (anyone want to mail me the DISKPARAM init?).

Re: TT vs. 386
Don't forget the TT can also run all your current TOS software. Well, it could if you could get one... :-)

Personally, I think TT vs 386 / Atari vs Amiga / etc. has gotten out of hand. Each machine has its own strengths and weaknesses in the areas of available s/w, h/w cost, support, etc. The more I read, the more I'm beginning to see Atari is not alone with their product problems. Ask a Mac person about the Imagewriter LQ... In the end though, I'd like to suggest that everyone just go out and buy the system they like best and quietly go off and use the thing for something besides posting flames.

Steve Goldstein steveg@saic.com

From: andyc@hplsla.HP.COM
Message-ID: <5440068@hplsla.HP.COM>
Source record: 247901

i am not enamoured of the "more" command. i have my own version that
is more to my liking (ie. i can search forward/backward, back up a
page, choose another file, ...). does anybody know of a way to call
a user defined piece of code instead of the routine that gets called
when i doubleclick on a file and choose "show"?

I have a way to do this, but it's pretty kludgy. First, let me state I am
doing this is in Neodesk 2.04; I haven't tried it in the TOS desktop. Even in
Neodesk, I don't think this is supposed to work. So here's what I did. I
first installed my preferred "more" as an application for two file suffixes.
The problem is, that's not enough, I need about a dozen suffixes. So, I
edited the neodesk.inf file and found the line that installed the
application. I duplicated this line as much as I needed immediately below the
existing line, and changed the suffixes in the duplicate lines. Well, what do
you know, but it worked - have my preferred more installed for a dozen
suffixes! I've been doing this for a couple of months, and nothing has gotten
upset about it yet.

Well, I know you can *try* to do the same thing to the TOS desktop.inf file,
but I have no idea if it will work.

>pounds with 1280x960monitor and a 60MEG hard-disk. (This is not as sure
>as the German information, though.)
>
>I have also read that atari would announce a version of Unix for about
>300 dollars.

I've read many things that Atari "will do" or "has done". In early 1986 Jack Tramiel was quoted in an interview with START magazine as saying that the "68020-based TT" would be shipping "within a few months". I don't believe he suggested a price.

Also in early 1986, the Atari CD-ROM drive was announced, although they did leave themselves the out that it wouldn't be shipped until it could be "priced appropriately".

The Atari laser printer was originally to have been (rumor said, although I believe some of those rumors originated within Atari) an "under $1,000 (list-price) printer".

Believe it, not when you can merely see and touch it, but when your order for one is filled and you *OWN* it. Until then, it's all merely interesting hearsay -- not only the "What" and "When", but also the "If" and "How Much".

>I know that Atari supports Europe more than the US. I can imagine why...

Why? Explain, please. Presumably Europe is more tolerant of vapor?

>wrong. The graphics are the user's view of the machine. They determine
>how valuable the machine is to the user. I don't doubt that the Mac's
>good looks make user think that the $2K she/he just threw down for a
>Plus was actually worth it. (We can laugh at how much Mac buyers are
>overcharged, but the buyers are satisfied.

This is pretty sad. Great, I got a Mac Plus with its _wonderous_ user interface. Unfortunately, it takes a lifetime to re-calc a spreadsheet, find things, etc. good grief, a little 8-MHz 68000 simply can't handle the interface alone, let alone any applications. I wouldn't buy a Mac (at least not a little one) if my life depended on it. A IIx approaches, a IIci is the slowest one I'd buy. But it's kinda expensive.
Graphic capability _does_ _not_ determine the usefullness of the machine. If this was true, I guess IBM wouldn't even have a machine now, would they? It took them up til now to come up with a reasonable graphics standard that's outdated. But you'll note the machine is still used a little.
I guess the old Altair-8800 wasn't useful, 'cuz the only graphics it had were a bunch o' little red lights. Forget that it was extremely important in bringing computers to people. The old Apple][, forget it. No graphics to speak of. (Unmatched in its time of course, but ignore that for now.) And _please_ forget nearly every straight Unix box _ever_ created, 'cuz most Unix stuff doesn't have too many graphics.
Now that I think about it, I guess you're right. Sorry. (Sarcasm.)

>& Live each day as if it were your first

If I did that, I'd be screaming, getting spanked by someone in white, vomiting Pablum, belching, and sleeping all the time. Hey wait a minnit...

>From what I have found out Malloc (-1L) returns the *sum* of the
>sizes of *all* free memory chunks.

This is emphatically not the case, and never has been.

The original answer was right: it returns the size of the LARGEST
SINGLE CHUNK of free memory. A common way to find out how much memory
there is in the system is to call Malloc(-1L) many times, each time
allocating a chunk of the size it returns, until it returns zero.
Then you report the answer and Mfree() all the chunks you allocated.

Of course, Malloc(-1) is evil if you're in a multi-tasking environment,
because in the time between the Malloc(-1) and actually allocating the
block of the size it reported, you could be preempted and somebody else
might allocate that block away from you! This is only one of a whole
class of problems which a multitasking TOS would have to address: the
single-thread, global, I-own-the-machine nature of TOS applications.

1935. Re: TOS 1.4 AUTO bug

Newsgroup: comp.sys.atari.st
Date: 1989-10-23 19:34:18 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440069@hplsla.HP.COM>
Source record: 247907

I, too, have a Mega ST2 with TOS 1.4, and I run Neodesk 2.04 as an AUTO application. I do not use UNITERM, but I am seeing some similar sorts of things, I think, and in my comm program as well. Everything went okay in the past week since the TOS 1.4 upgrade until yesterday, when I had *5* "random" system crashes. This is a very rare problem in my experience.

One crash occured when I double-clicked HDUTIL.PRG 4.1.8 - the disk access began, and whammo, address error. Three times I had address errors in Interlink (one in the middle of a 200K GENIE download). But two of these were using the buffer editor, and I have had that crash before). These three crashes were followed by subsequent crashes on cold reboot (keyboard-invoked). It took two cold reboots to get things running again. The fifth crash was when I tried to extract from a file archive. After reboot, it worked just fine. Did I mention - these were all address errors!!!

I have two suspicions at this point - a hardware problem (oooh noooo!!!) or maybe I am experiencing some residual effects of having set the "fast" bit in just about everything I use. (That, in fact, is the first thing I am going to do, unset the fast bit in Neodesk, Hdutils & Interlink. I don't think I set it in arc, though I'll check.)

So, I would also like to know if any of the Atari folk have a suggestion!

>> very few programs especially for it. The more people keep supporting only
>> the PC-line (XT, AT, 386...), the more technology has to go along the
>> same traditional tracks.
>>
-> I don't know about Finland, but here there are more PC's on desktops for the
-> small business and home user than loose paperclips :-). Seriously, the
-> amount of PC's abound is sickening. If it's not an industry standard,
-> tell me what is. Besides, you said more people supporting one line,
-> the more technology has to go along the same tracks ... doesn't this
-> sound like industry standardization?
>
We sure have tons of PC's here in Finland. I was talking about 386
specific software and there is not very much of it! The TT will be ST
compatible, just like the 386 is PC-compatible, and MAC II is
MAC-compatible! I think it won't take
very long, when there is as much TT specific software as there is 386
specific software. By the way, I can use a lot of PC- or MAC-software on
the ST, too. The coin (the industry standardization) has, as always, two
sides. The good one is that you can get a lot of software. The bad one
is the dependence on old technology. The same problem is with ST's and
TT's, too - but the PC is older standard.

> (Jouni Alkio) continues:
> I have got every program I've needed for my Atari ST this far. Usually
> they are more user-friendly than their PC-counterparts. I think it is stupid

> it in Germany. (And if it wouldn't come, Atari could soon be in bankrupt
> or something...)
>
-> I also have just about every program I've needed for my Atari ST, too.
-> Almost every. There are things for our SUNs that I wouldn't mind having,
-> but my biggest hang up is the fact that the same programs available on
-> other machines are so much more powerful, nicer, AVAILABLE, and supported.

If I have a program for my computer, isn't it available?!?!? Could you
give an example of a program more powerful on a PC (in the same
price-range, not a 386, for example)?
>
> Jouni Alkio:

> What's so important in having INTERNAL modems, etc... You can buy all
> off those devices for ST's and TT's, too.
>
-> Just take a look at my desk, and you'll see the advantage of INTERNAL stuff.
-> I've got my 1040 sitting on it. A huge cable comes out for my external disk
-> drive, which is also propped up vertically against the wall behind the desk;
-> I've got another cable coming out to the Atari EXTERNAL harddrive that's too
-> big for 20 Meg, and sounds like a 747 during takeoff. Then I've got another
-> cable coming out to my EXTERNAL modem. And, finally, cables going out to
-> my printer and my two monitors. It's a mess! If my 1040 were more like
-> a Mega (which is also too small), and if I could put the harddrive, diskdrive,
-> and modem all inside it on CARDS, I'd just have to worry about hiding the
-> cable for the printer---and that's easy by just throwing it behind the bloody
-> CPU box with its nice INTERNAL cards.

I like having various devices on my desk. This doesn't mean that I
couldn't use them. I admit that some people like emptier desks - and
it's also practical in the offices, for example. For me, it's a matter
of taste. It's not my fault if you have bought a noisy hard-disk. You
are free to choose. Or do you mean that a PC-case would prevent the
hard-disk from being so noisy?!?!?

>
>> Chris writes:
>> Now that I've got my own little 68030 worksation (named after a popular

> Jouni says:
> Why compare an Apple with 68030 to an ST?!?! Compare a MAC to a ST and
> compare their price, too! A ST costs only less than a third of a rival
> MAC, at least here in Finland. You can still emulate a MAC with a ST
> even faster than a real MAC. Where does all that extra money Apple takes go?
>
-> Chris is not comparing an Apple II to an ST. In fact, I don't know of any
-> Apple II that has a 68030. He OBVIOUSLY means his Mac. Get a clue :-)
-> And my ST can NEVER beat the nearby Mac II in terms of speed or graphics.

Wait a minute, I didn't write anything about Apple II (and if I did, I
meaned Apple MAC II, of course)! I just didn't like the
speed comparison between A 68030 APPLE AND A 68000 ST, it is unfair! OF
COURSE a MAC II is technically much better than a ST - you could as well
compare a MAC II with a supercomputer... It makes no sense comparing
computers in completely other price-ranges.
>
>> Richard says:
>> So, from past experience we can expect a CHEAP 68030 machine from Atari
>> that won't be expandable and will be margin in other aspects.
>
> Sounds right. When I was still a fanatic, I was convinced that the Atari
> was the most powerful computer out for the price. For only a few hundred

> dollars more (I had the money) I could have gotten (ack) an Amiga (oh no!).
> Or something that has support. Dare I say it? Yes, a Mac.

What do you relly mean by that support? I wouldn't pay much extra money
for getting some brochures, for example. One fact is, that you are
slightly in another position as I - Europe is Atari's first marketing
area for computers, as far as I know.
>
> Jouni replies:
> How come won't be expandable??? You can even expand a ST very well, even
> if it doesn't actually have ANY card slots... By the way, remember MIDI,
> too.
>
-> Sure I guess you can expand an ST `very well,' but it isn't easy. You just
-> don't lift the cover a drop in a card. You lift the cover, desolder a chip,
-> patch a jumper, solder a socket, pay through the nose for parts, and labor
-> if you don't know how.

It doesn't have to be so easy if you are a bit handy. It would be nice
if I just could insert the cards in their sockets, but it really doesn't
matter very much for me.
>
-> Yes, the ST's are inexpensive. That's great. If you want it now, though,
-> forget it. And support? I've sent out all the warranty cards I could
-> from my Atari stuff, and I've never gotten a single brochure from Atari,
-> or a newsletter, or anything. I wonder if there's anybody back there.
-> Authorized repair centers? We don't need no stinking authorized repair
-> centers!

As I said before in this article, I wouldn't like to pay much extra for
some brochures.

1937. Atari Lynx & Announcements vs. shippings

Newsgroup: comp.sys.atari.st
Date: 1989-10-23 19:45:06 UTC
From: JALKIO@cc.helsinki.fi
Message-ID: <1087@cc.helsinki.fi>
Source record: 247909

Would somebody, please, tell me something about the Atari Lynx? I don't even know what it is.

I have seen an article saying that Atari has promised not to announce new products before than 90 days before the beginning of shipping to customers. (This should be the fact with the TT, too.) I hope they'll keep their word. The TT has been announced in Germany, so it should be shipping in about two months, I think. (First in Europe, perhaps.)

1938. Re: TT vs 386 boxes and Apples

Newsgroup: comp.sys.atari.st
Date: 1989-10-23 20:01:41 UTC
From: david@bdt.UUCP
Message-ID: <162@bdt.UUCP>
Source record: 247919

[It's probably stupid to get in the middle of this but, oh well,
here I go again. :-)]

One thing I haven't seen brought up in this debate yet is the idea
of "shrink-wrapped configuration". What I mean by that is the way
somebody can buy a 386 box and the necessary boards and software to
set it up in a certain configuration using "over the counter" stuff
that is easy to get from a wide assortment of vendors and is generally
well supported.

I go into a lot of companies to do consulting where there are a bunch
of different types of computers, mostly running Unix. The thing about
PC-type 386 boxes is that you can get almost ANYTHING for the damned
things. Buy a box, somebody's Unix, an ethernet card, a SCSI card,
a graphics card, a scanner card, etc. etc. and you've got a usable
workstation - all with "plug-and-go" stuff, in a usable package.
You've got your PC on your net with your Suns etc. all with relatively
inexpensive and well supported products - and you have a wide choice
of vendors - and it actually works.

From the Atari die-hards in the peanut gallery, you'll hear "yea but you
can do that with the Atari too!". No way. I don't ever see Atari
getting the kind of 3rd party software/hardware support we have here
in the USA (maybe none of this applies to Europe, I don't know) for
the PC-type 386 boxes. As much as I *hate* the Intel junk and PC's
in general, I have to admit that there's no beating them in this area.

A TT with some limited connectivity and 3rd party support will sell
to a limited audience. There's a lot of catching up to do and I
just don't see Atari spending the resources to do it here in the USA.

Every year Sig says "I'm sorry for the poor support in the USA last
year... This year we are Really going after the US market." Hasn't
anyone tired of this yet? Does anybody still believe Atari gives
a damn about the US market? Why should they? The US market couldn't
give a damn about them.

^^^^^^^
That's not nice...

> We'll all be much happier.
> Greg Lindahl

Four more months! That's all? Let's see...???? I can wait that, easily!
After all, i've waited since June of '86 when my dealer told me
that ATARI was coming out with the TT and that it would stick on the
back of my 1040ST. So that will be less than 4 years total!
Not bad ATARI!

"Sounds like they have been doing a better job..."

BTW: does it matter to anyone in the USA or in CANADA
what is being shipped in Europe?
Turbo C by Borland lives in Europe...
Lots of neat stuff hangs out in Europe...
May not be a bad place to live, either....

-kevin

alright.. don't everyone start sending me EMIgration papers...

Why do I get the feeling that the people who are flaming me
for not having a TT on my desk own stock in ATARI?

1942. WANTED-- used DX/TX Editor Librarian software for Atari 1040ST 2meg

1943. DEC RD53 hard disk on an ST?

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 00:30:58 UTC
From: MBERNAR@ERENJ.BITNET
Message-ID: <8910240705.AA05654@ucbvax.Berkeley.EDU>
Source record: 247914

Has anyone connected the mech from a DEC RD53 hard disk to an ST? The mech which holds 30MB or so, is made by Quantum an I'm told that it is ST-506 compatible. It seems to me that these drives should be adaptable to an ST using an ACSI-SCSI interface along with an Adaptek controller. Right?

Recommendations would be appreciated.

This method is mainly satisfactory, but suffers from one major drawback:
the program must load from disk before it runs. I no longer have anywhere
near enough memory to keep a ram disk installed, but I do have enough to
store a TSR that provides a decent 'more' and print utility. The supplied
'more' utility runs directly from ROM ... can something in desktop.inf be
changed to tell it to run some code from a different place?

Cheers,

I have finally decided to throw in my two cents on this discussion.
The (I believe) 1988 Atari Corporate report to the stockholders stated that
the Atari was availible off the shelf in the Soviet Union. I am going down
to the University Library to get the report so that I can type that section
in. BTW: It may not be the 1988 stockholders report, it is probably one of
the early '89 quarterly reports.

I know, its vague. If you have access to Shareholders reports you
may want to read them to get an idea of how much Atari does sell.

1946. Re: Sound Digitizer for the ST (need recommandation)

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 03:41:03 UTC
From: drp9500@ultb.UUCP
Message-ID: <1469@ultb.UUCP>
Source record: 247917

Probably the best one out right now is DIGISOUND PROFESSIONAL ($149) it allows for high quality sampling that can be played either through the monitor or back through the cart. The software is good and easy to use, taking full GEM advantage. Sample rates are flexible ranging from 8 to 40. Documentation is GREAT showing you just how to use the samples in programs also gives you a byte by byte breakdown of the header info of teh samples. Great technical support from Alpha Systems. I own Digisound and Pro Sound Designer and Digisound just blows it away!!

Hope I helped....Bob

BTW all the digitizers that are below $200 are 8BIT!!! to get much better sound quality you should use 16BIT digitizers but they run from $500 and up!!!! But if that is what you are looking for, call Hybrid Arts and get the info on A.D.A.P. II, this digitizer kicks ass!

To: info-atari16@ucbvax.berkeley.edu

About Softeware documentation.
The programs that sells good, tends to get translated. Many PC programs gets tanslated, and fewer for the ST. Programs like DEGAS SIGNUM and 1.ST WORD are all translated to danish. I'm not sure if the translation is really needed, because the ST users in Denmarks is mostly non-pro. compared to the PC users. Therefore many of them is used to reading english manuals and using english programs, while many users in buissines are not used to this. I think ATARI Denmark translates these program, to attrackt buissines users. If you are making a com. program i think that a translation is a must.

About the printers.
The people i know who own a printer (including my self) all use US standard tractor paper. But most buissines documents or letters are written on A4 size paper.

1949. Re: Spectre GCR availability?

B Holme ask if the Spectre GCR is available yet?

I sent a message to Dan Moore 2 days ago because I cannot contact Dave Small (his Bitnet address is so complicate that I don't kow how to fill it in the UserID and NodeID).

Dan mentioned to me that (I sure that he would not mind I'm qouting his message) he met Dave on 19 October and had told that Spectre GCR has been shipping out to those pre-orders for at least 4 Weeks. Gadgets by Small just received another production run of the cartridge (few hundred pcs) and now busy stuffing them into the boxs. Dan also does not know when they will finish clearing the pre-order lot. I have ordered 4 Pcs of Spectre GCR since July and still keep watching for the Federal Express man to apprear at my front door.

If any other Atari ST developers in the UK reading this newsgroup think they
get adequate support from Atari UK will they please identify themselves.
I am keen to know what makes you so special in their eyes.

Were you a TOS 1.4 beta tester?
Have you got an 6/4/89 Rainbow TOS chipset + developer release notes?
Have you been offered upgrades to Madmac, ALN or even db?
Do you now have S.A.L.A.D,
The Pexec cookbook,
modern circuit diagrams (not a 1985 520ST),
Mega expansion port docs
Maths co-processor docs
Mega clock docs
When did you last get a developers newsletter (whoops sorry, I meant corner
stapled photocopy)
What do you now know about the STE specific hardware, the Stacey and the TT?

Still think you're getting adequate support?

I believe there is an international standard (made some time in the
mid-1970s) stating that the first day of the week is Monday.

Very un-Biblical.

As usual, the English-speaking countries have decided not to follow
the international standard. :-) I don't blame them, this one is quite
silly.

| ya, this is actually easier than you most people think. simply use some sort
| of desktop.inf editor (ie: QUIKINF.PRG, a fine Quick Utility) to edit
| the installed applications for your machine. simply pick your favorite text
| editor as the installed application, and set the application mask to be
| what ever document you want to look at: ie: if you want to look at all *.C
| *.H, *.DOC and *.TXT files using TEMPUS.PRG, simply install tempus.PRG as
| the installed application and for each installation give it one the above
| search masks. once you re-install that desktop.inf file (ie: reboot, or exit
| from QUIKINF.PRG), you can then click on any *.DOC file (or any of the
| masks you set up in the desktop.inf file) and TEMPUS.PRG will automatically
| come up with the file loaded for you. simple, eh!!!
|
As for me, I have added the following line to desktop.inf:
#F FF 04 c:\bin\filespy.prg@ *.*@

and, each time i click on a not-executable file, filespy is called
automatically and displays this file. Unfortunately, you can't see
another file using f6 funcion key from filespy because mouse is not activated.

So, I have installed filespy as a GEM app, suffix: *. Now, I can use f6
function key, BUT BUT... I have no more executable files! All files are
displayed by filespy! I can't even de-install filespy.prg as it is no
more an exec file! Fortunately, i have not saved this desktop, so a
reboot has corrected this trouble.

My question is: is there a way to specify all files except PRG, APP,
TTP, TOS?

One little thing I forgot to mention in my reply yesterday, in which I explained the size of A4 tractor feed (80 col by 70 lines is near enough). If you are writing something where 'beautiful page formatting' doesn't really matter, like say a compiler which produces printable listing files, and you don't want to special-case A4 support, there is still a little trick which makes life easier for users of A4 paper.

That is, simply, to end your page with a FormFeed character, rather than counting lines and skipping to EOF using NewLines. Sure, a printer setup for A4 will then waste 4 lines per page, but at least each page will really be on a page rather than slowly creeping across the folds. People writing docfiles which are intended to be printed out by the user could well consider this idea as well.

> Don't you know anyone who owns an Apple Lisa?........

That's right! One important point to think about when blaming Atari for
being slow is: It is much more difficult to design a computer which
costs, say 1000$, than one that costs 2000$ (if both of these are about
as effective and are using the same CPU). Atari can't let out a computer
which still is too expensive to be "Power without the Price". And, as Andrew
already wrote, Atari HAS brought very varied and original products lately.
For example, the portfolio is said to be the smallest PC in the world.
(I must be sounding like an Atari salesman...)

Many writers have again written and argued about different machines. I would say that computer is a machine, not a toy or god. You seem to take this branch very religiously, believing to Atari TT or MacIntosh or "Industry standard" or whatever.

Only comment from me is that every machine or operating system that breaks monopolies are supportable. If Atari TT runs unix, msdos and MacIntosh, I'll buy it any day. I don't have Atari, yet.

It would be reasonable to use best machine to each purpose, not machine I "believe" in.

It's quite useless to write articless like yours. Post system is allready overloaded and we don't need this kind of garbage to fill our machines.

PS. These opinions are my own.

1956. Graphics interfaces

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 13:17:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8910250702.AA02215@ucbvax.Berkeley.EDU>
Source record: 247928

One netter used the argument that graphics interfaces are not important and the proof was that there a zillions of PCs without such interfaces.

Unfortunately, business leaders felt that if you gave an employee a computer, he would be able to use it effectively because computers are so powerful. What business types did not realize is that the PC, with its lack of a human tolerable interface, would cost them incredible amounts of $$$$ in training, re-training, re-training.....

At my workplace, we have over 400 PCs, 150+ Macs and just under 100 Ataris. To support PC users, there are dBASE courses, Word Perfect courses, LOTUS courses etc. Why?, no common interface. There are NO Mac or Atari specific courses because they're not needed - we do quite all right without them.

Any PC user who quotes "286/33MHz" to you does not understand or refuses to accept the concept that moving data between appl is just as important as using appl (except for the poor PC user who only knows one appl.).

In research, more time is spent doing reports than number crunching. For handling data and report generation, the PC cannot touch the Mac.

1957. 386's, TT's, a machine I want

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 13:39:45 UTC
From: winston@fjcnet.GOV
Message-ID: <211@fjcp60.GOV>
Source record: 247929

I've been reading a lot of the messages in this group lately and one thing is clear - while the rest of the computing world has progressed into the late 80's, Atari is still stuck with early 1980's technology. One of the reasons I bought my ST was it's price - it afforded me the same computing capability as a Mac (and a 6mhz AT) for a much lower price. In many ways, I got what I paid for - a lack of programs that I'd really like to use. Sure there's Word Perfect, a couple of decent C compilers, and some really terrific PD programs. There are even good CAD and DTP applications available. Still, have you ever noticed that even some of the most used programs on the ST (Flash is a glaring example) is feature deficient when compared to programs available on other machines?

I've always wanted a nice Lisp interpreter/compiler/development system for the ST. On the MS-DOS world, there's PC-Scheme, which is just one heck of a system (and it's affordable). On the Mac, I use Allegro CL and MacScheme+Toolsmith, both excellent products. On the ST, you have Cambridge Lisp (okay, so it's a lot slower than other Lisp implementations out there, when using the interpreter). While the initial investment with regards to procuring an ST is low, most of the cost of owning a computer is spent on the time spent using it. Without adequate software support, the nicest machine will only gather dust.

I don't have an ST now, although I've kept a lot of my old ST software. I bought an Amiga a little later than my ST and while Commodore has not been much better at letting the world know what a neat little computer it has in the Amiga, I find that I could do a lot of things with the Amiga that I could not do with the ST (e.g. I can compile CLIPS, NASA's expert system shell with Lattice C; none of the ST compilers I own [Laser C, Mark Williams, Prospero] can do this). Lately, I've even seen some ads for the Amiga on national TV (as well as promotional video tapes on some local software and hardware houses). I have seen ads for the Portfolio, but what does that have to do with the ST? Or the TT (after reading the specs of this machine, I could not believe I waited four years for something that "advanced"). I have a Mac IIcx at work - something tangible I can use with software that I use and need. How many people do you think will write software for the TT (at least here in the U.S.). Do you think Word Perfect Corporation will be out there in the front line releasing their latest software for the ST/STE/TT?

The bottom line is, the best deal available on the computing world are the myriads of 386 boxes available NOW. You can buy Unix for it now and get some good PD development tools. And if you're desperate, you can even run MS-DOS. If Intel CPU's are not your bag, the Mac IIcx and IIci are really nice boxes with tons of software available.

I guess count me as another disillusioned ex-ST user.

Winston "a computer is just a tool" Llamas

I entirely agree. But one would have to admit that there is a big
difference in money spent between a CD-ROM or a graphics package, than
the money spent on a new line of computer (well, enhancement at least).
If a company is going to sink a couple years and a couple million dollars
into developing a computer they think the market wants, why would you
then think someone inside would sabotage it's release. This is the way
everyone talked before the release of the Mega line (not so much the ST).
No one thought Atari had the balls to release a computer that might, even
in the littlest way, be expandable. I'm sure there are HUNDREDS of ideas,
some of them good I bet, that get left behind every year. The TT is not
one of them.

You fell for that old one?!! There is a difference between rumor and
an idea about to come to market.

> Why do I get the feeling that the people who are flaming me
> for not having a TT on my desk own stock in ATARI?

All I ask for is that we give Atari as many fair chances as possible. If
Atari goes down in flames, it is because of bad management and no support
from the public. If the public supports, the bad management usually works
out. If the public doesn't support, bye bye Atari, bye bye new ideas,
bye bye change....

1960. More on Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 15:02:01 UTC
From: steveg@SAIC.COM
Message-ID: <8910241502.AA03205@NARNIA.SAIC.COM>
Source record: 247932

Here's a quick update on the Spectre GCR. I had an enlightening conversation yesterday with Doug Wheeler, who informed me that a run of the Mac format PD disks distributed with the GCR have problems around tracks 1 thru 5. Thus the 'known good' disk is bad, but you should be able to read 95% of the disk. Thus before you go off and start adjusting the pot in the GCR, try reading and writing to some other disks. You may find that you're calibrated fine.

For those who do need to tweak the beast, there is a 'problem' with the imbedded GCR test software in that some test functions will only operate on drive B:. Doug explained that basically the code was for internal testing, and that they had debated whether or not to let people have access to it. In this light, I can understand the limitation, but be forewarned, the "t", "T", "c", and "C" test commands go straight to drive B:, and try to format IMMEDIATELY!. If you have only one floppy, the code will report errors and get caught in an infinite loop. There are other test options available that will work fine on a single floppy system (or in my case, where the 2nd floppy is 5-1/4").

Please don't take the above out of context. The GCR is a good product. And based on my conversation yesterday, the support is outstanding - taking the time to explain not only what the problem was but WHY things work that way - seems their test machine is a two floppy 520 - test program in drive A:, disk to format in drive B:.

Disclaimer: I am in no way affiliated with Dave Small or Gadgets by Small, except as a satisfied Magic Sac/Translator One/Spectre 128/
Spectre GCR owner.

P.S. Translator One for sale - any offers?

1961. Does a graphic interface slow a machine?

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 15:07:35 UTC
From: MEGGIN@vm.epas.utoronto.ca
Message-ID: <89Oct24.111444edt.57651@ugw.utcs.utoronto.ca>
Source record: 247933

Whoa! I won't embarass anyone by naming names, but someone in this newsgroup recently suggested that a Mac takes a long time to recalculate a spread-sheet because the 8mhz 68000 chip is already busy with the interface. Wrong.

When a Mac is recalculating a spreadsheet, or doing any other computational chore, the processor is dedicated only to the programmer's code and any interrupts (such as mouse movement). It is not worrying about drawing windows or handling menus until the user calls a system function. If the spreadsheet is slow, it's bad coding. The interface has little to do with it.

David Megginson, Centre for Medieval Studies, Toronto

1962. NeoDesk, Shel_fix and CRICIT

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 15:16:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8910250703.AA02336@ucbvax.Berkeley.EDU>
Source record: 247934

Codes that call other codes (e.g Signum calling its printer routines, EasyDraw calling OUTPRINT.PRG) needed shel_fix to work properly. Yes, I use shel_fix and it works - except on CRICIT. CRICIT editor will not call CRICIT register and vice versa if these codes were launched from NeoDesk. They work properly when launched from the standard desktop.

Anyone know why (Dan Wilga, are you out there?)?

1963. Pleeeeaaaasssssseeeee, Atari!

Source record: 247935

If there are any executives (or anyone else, for that matter) at Atari reading this, WHEN ARE WE GOING TO SEE THE TT RELEASED? WHAT IS HOLDING YOU GUYS UP?!?!?! You have a bunch of us here on the net drooling over the specs of this machine that has only been seen in that fantasyland called Europe. If you have the machines on your desks, why won't you release them to therest of the US.

I want a machine with an '030! I'd rather rip off my finger and toenails than buy a Mac IIcx (even if I could afford one!), because I'd eventually want to program the blasted thing. I won't complain if Unix System V is not released with it immediately. I want to play around with the '030.

I'm down on my knees begging! Let's put the wheels in motion and get this machine out the door. I want a machine with an '030. I WANT A TT NOW (or as soon as you can get the machine into production, or yesterday, whichever is sooner.)

I dare you to release the TT in the US!

#include <disclaimer>

1964. 82 tracks, twister, etc.

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 16:03:11 UTC
From: krieg@jupiter.uucp
Message-ID: <1295@mrsvr.UUCP>
Source record: 247936

I have a few questions about disks and disk formatting for the ST.

1) I use Universal Item Selector II and it has an option for formatting disks. They offer a format scheme known as Twister format. What is this? Why would I want to use it? Can all drives read it?

2) I have both the Atari single-sided and double-sided drives. Both of these drives allow me to format up to 82 tracks, but they can't seem to read past the 80th track. Should this be? Why can it format out to 82 but only read up to 80? I'm confused. If I formatted with Twister, could I read up to the 82nd track?

3) Are there any 3rd party drives that support 1.4M disks? By suuport I don't mean that they will format them to 800K but to the full 1.4M mark.

In conclusion, I'd like to state that I'm sick of all the TT/386/Apple bashing. Let's stick to ST information, etc. for a while.

> track record, I am willing to believe that Atari R&D has their act together.

So, just *WHAT* has ATARI released in the last 3 years??
First, they came out with the Mega ST line. The Megas could have been a great chance for Atari to increase color graphics and/or sound (ala the VaporWare 1040STE). the Mega could have been a chance for Atari to provide a wide open computer with plenty of open card slots. The Mega could have been a chance for Atari to fix some hardware problems (like why didn't Atari add a DMA port buffer so that you can drive 2 external harddrives AND the SLM804 laser printer?). The Mega could have been expandable from 2 megabytes to 4 megabytes. The BLitter chip could have had ALL of the features that were originally promised 3 years ago. Needless to say, none of these things were done, and the Mega was promised to be a "Business" computer, so they should have been done. Cost would be a minor consideration when buying a Top Of The Line computer.

> I remember when the 520 was announced. I had my reservations, that computer
> meant that Atari had to drop an entire train of thought. No more 8 bit.
> Just 16 bit. I was amazed when it came out. Then the 1040. Then the Mega
> line, a real jump.

The Mega was a great improvement over the other STs. I even bought one.
But, the Mega is NOT a great computer. It lacks any real new features except a detached keyboard, a Blitter chip and a TOS to control the Blitter chip.

> Then the (cheap, good quality) laser printer.

Yes, the SLM804 is a CHEAP laser printer. And that is it only marketable feature. NOTHING has been done by Atari to support the SLM804 in over 18 months. No new Diablo 630 Emulator, no Epson Emulator, no new GDOS driver, no new anything. And don't bring up UltraScript because that wasn't written by Atari. US was written by Imagen, bless them!!

Just try using that SLM804 on the Gadget's By Small SPECTRE 128/GCR. The best you can get is 144 dpi printing w/o resorting to UltraScript. so much for the Quality and Versatility of the SLM804.

And now that HP has released the LaserJet IIP for $995.00, I just wonder how many SLM804s will be sold. I know that I would buy the HP printer before buying the SLM804 if I was to buy a laser printer today.

> Then
> the transputer (an AFFORDABLE parrallel prcessing unit for END-USER's).

Well, I don't know what continent you live BUT the ATW is NOT being sold
here in the US. I do understand that Canadians and English folks can buy
it. So, maybe the ATW is not VaporWare, though the US hasn't seen it yet.

> Porfolio and STacy following soon. Now there is a Transputer workstation.

right, there is Portfolio. But, Portfolio was designed and built by DIP,
a British company. Atari is JUST amrketing it. Just like Atari markets that
expensive line of calculators! Boy, I will bet you are proud of those
calculator also, hih?

And just *WHERE* is the STacy?? Is it selling in Europe?? Is it selling
in Canada?? I *KNOW* that you can't buy the STacy in the United States.
So, as far as I am concerned the STacy is just more Tramiel VaporWare.

> It goes on and on, all the while, spurring companies like Wordperfect Corp.
> and others to support it.

Ah, Word Perfect. Did you know that WP dropped development of the ST version
of WP because of non-existant support from Atari?? Did you know that the
Atari FANASTIC CHEAP SLM804 laser printer in NOT a supported printer by
WP?? that's because of all of the bugs in the SLM804's Diablo Emulator,
which of course hasn't been updated in over 18 months!! So, WP dropped
the SLM804. And it looks like Atari has also!!

As far as other companies supporting the Atari: where are Microsoft, Lotus,
WORDSTAR, Dbase?? where are all of the IBM software companies?? If the
ST was a viable market those companies, and more, would be fighting to
grab a piece of the ST market. Nope, none of them are marketing ANY ST
software. That speaks volumes for the US ST market!!

> Atari has had no easy task over the last three
> to five years, I think they have done pretty well. It is time we get over

> Don't you know anyone who owns an Apple Lisa?........

No, but I know of the Mac SE, the Mac SE/30, the Mac II, the Mac IIx, the
Mac IIcx, the Mac IIci, etc. and then all of the Compaqs, and IBM pcs. Etc.
all of which are first class computers.

Oh, that explains it!! An experienced computer engineer with YEARS of real world experience!! And andrew lives in Canada, so he gets new Atari stuff before us lower Americans!!

Well, I am sorry to continue flaming Atari BUT messages like the above from folks just get my goat!! I like my STs better than any other, but I refuse to follow the Atari party line any longer. I will keep my ST for years, but will NEVER buy another Atari product!!

********** GOOD NEWS SECTION **********
As part of my continuing efforts, I would like to talk about the the game OIDS. I don't always just respond to USENET messages, I sometimes play games. And OIDS is an old game that I still find addicting!! You fly a small spaceship blasting enemies on the ground and in space. Some enemies fly at you and fire at you. Some enemies are stationary. You must resuce little men from jails by blasting the jails but not them!! You get an extra spaceship for each 8 men that you rescue. Your spaceship is very mobile, and the play is fast and furious!! And you can design your own OIDS galaxies with the builtin editor. All in all a great little game. I like it!

1966. the ST and the HP DJ+

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 16:22:11 UTC
From: keithr@vice.ICO.TEK.COM
Message-ID: <4269@vice.ICO.TEK.COM>
Source record: 247938

A short while ago there was a lot of discussion on problems the DJ+ was having with the ST (or the ST was having with the DJ+). I have a DJ (no +) and have had no problems, but my church is getting ready to purchase a DJ+ for their ST. Is there anything special that should be done in connecting it to the ST? Maybe just as a precaution?

Thank you for your help,

Keith

[comments about the second statement deleted]

I suppose my second statement was an opinion, that made
my first statement less clear, namely that PC != MS-DOS

1968. Re: anybody know how to "hook" into MORE?

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 17:17:17 UTC
From: leilabd@syma.sussex.ac.uk
Message-ID: <1452@syma.sussex.ac.uk>
Source record: 247940

miken@hcr.UUCP (Mike Nemeth) writes:
>
> i am not enamoured of the "more" command. i have my own version that
> is more to my liking (ie. i can search forward/backward, back up a
> page, choose another file, ...). does anybody know of a way to call
> a user defined piece of code instead of the routine that gets called
> when i doubleclick on a file and choose "show"?

I enclose details of how to do this originally posted by Moshe Braner
when he posted his version of more some years ago:

----------Start of excerpt----------
Submitted-by: braner@tcgould.tn.cornell.edu (Moshe Braner)
Posting-number: Volume 1, Issue 41
Archive-name: more

To judge from mail I've been getting, it is time for a repost of MORE.TTP.
This is a little utility to print text files to the screen or a printer.
See the doc file, or invoke MORE with an empty command line for brief help.
I have replaced the desktop "SHOW/PRINT" thing (ugh!) so that when
I double-click on a document it is shown via MORE. To do that I
modified the desktop.inf file. The last lines of it now say:

...
#T 00 07 02 FF BLACK HOLE@ @
#F FF 04 C:\BIN\MORE.TTP@ *.*@
#D FF 01 @ *.*@
#G 03 FF *.APP@ @
#G 03 FF *.PRG@ @
#F 03 04 *.TOS@ @
#P 03 04 *.TTP@ @

Works like a charm. I just wish MORE would work from inside the Laser C
shell -- I don't know why it does not.
----------End of excerpt----------

Maybe Mike should consider submitting his version of more to the
binaries/sources group. I like and use Moshe's version but it only
allows one file to be inspected per invocation. Another alternative is
less but the ST version doesn't expand wildcards (and neither does
TOS) which is frustrating.

I have had bad luck with a sony mechanism I bought from them (jameco).
It will read but not write. Somebody else I believe had similar problems
on the net. I sent the mechanism back to them and they said it
checked out on their PCs fine.

Anybody wants mine can have it for $55 including a 99% complete PC
installation kit -- only thing missing from the kit is a 5 1/4"
faceplate -- has cage, power and card edge adapters.

1971. ICD FAST Tape Backup

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 17:45:07 UTC
From: covertr@force.UUCP
Message-ID: <466c291a.14a1f@force.UUCP>
Source record: 247943

I need to backup my 130 meg hard drives on my Mega ST4 and
am interested in hearing from anyone about the ICD FAST Tape
Backup. I understand that it lists for about $900. But, the
tapes are 150 megabytes and cost about $30 (US dollars).

the 44 megabyte removable sysquest drive can be added to
my Toad computers hard drive for an addtional $700, but the
cartridges are $110 each. and they are only 44 meg each. so, while the
ICD FAST Tape is more expensive I would save in the long run on the
tapes. The bad thing is that the tapes are slower then the removable
drive cartridge and can't be used as online storage. If the removable
cartridges sold for about $30 I would go with it.

so, does anyone have the ICD FAST Tape backup??

What do you think of it?

How reliable are the tapes?

Can you do a file by file backup (backup an entire partition file by
file)?

Can you restore an individual file from tape??

What is the shelf life of the tapes?? Can I store them for years
w/o losing data?

Please post your experiences with either the removable drive cartridge
or with the ICD FAST Tape unit.

Thanks.

Richard Covert

1972. What micros are available in France?

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 17:47:06 UTC
From: leilabd@syma.sussex.ac.uk
Message-ID: <1453@syma.sussex.ac.uk>
Source record: 247806
Cross-posted to: eunet.general,comp.sys.atari.st,comp.sys.ibm.pc

I have been asked by some not very wealthy (English) friends who live in France to advise them on buying a micro. They aren't likely to want to bring it back to the UK, but they will want to get hold of documentation in English. They would want to use it for word processing and maybe a bit of simple (Basic?) programming. They also have two small children who may at some stage be exposed to computers at school but I don't know what if any computers they use in French schools.

My current thoughts, given their (small) budget, tend towards either a PC XT clone which is also available in the UK (so that English documentation could be obtained) or an Atari 520ST (likewise).

I don't need to be told about the relative merits of PCs and STs and I certainly don't want to start a religious war, but if anyone knows anything about the availability of machines in France or what machines are used in French schools, I would be very interested to hear. (BTW, my friends live in SW France, near Pau.)

I'll summarise replies to the net if appropriate.

Leila

JALKIO@cc.helsinki.fi (Jouni Alkio) writes:
>Would somebody, please, tell me something about the Atari Lynx? I don't
>even know what it is.

Lynx is a handheld game system. It has a 2" color LCD screen, sound, a joystick-like controller, and the ability to link multiple Lynxes (hence the name, pronounced "links") for many people to play games with or against each other.

It also has built-in hardware for such normally time-consuming operations as multiplying and scaling of sprites (that is, changing the size of a part of the picture).

It is similar in concept to Nintendo's Game Boy, but MUCH cooler: besides the hardware assist for some operations, Lynx is in color, not black and white, and you can only connect two Game Boys, while you can connect 8 or more Lynxes together.

As for delivery dates for Lynx and TT, don't ask me: I just work here. (I am in engineering, not production or marketing: I simply don't know the answers to questions like "when will it ship?")

There is only one released version of TOS 1.4. All others are "test"
releases, "developer" releases, or "beta" releases (as in beta-test).
I don't know the date of the official TOS 1.4 release; I will ask John
Townsend to post the date you should find in the ROMs so you'll all
know if you've got the official version.

it would appear to be time to post parts of
a discussion that has appeared here before ....

deskLESS.see.Z

Jan 22 11:05 1987 Page 1

There is more that can be done to modify the behaviour of
the ST desktop than appears to be gernerally realised, so hope
that the following notes are of use. Any information from those
that can shed further light would be nice.

Desktop.inf contains
plain ascii text, and the names of installed applications can be
edited to include path information.
There are other useful modificaions that can be made, to configure
the behaviour of the desktop.

Recently, people have queried whether it was possible to do anything
about the action of the desktop, when displaying/printing a file.
This is particularly relevant now that LESS is available.
The few lines of desktop.inf before the application instalation
information are :

```
#F FF 04 @ *.*@
#D FF 01 @ *.*@
#G 03 FF *.APP@ @
#G 03 FF *.PRG@ @
#F 03 04 *.TOS@ @
#P 03 04 *.TTP@ @

#P 03 04 d:\DUMP.TTP@ *.BAS@
```

The action of the desktop is clearly to try matching a 'double-clicked'
file against these templates, IN REVERSE ORDER.
Once a match has been made, the desktop then takes either the specified
action, or if none, the default action.

[Thus if the bottom template is changed to @ *.*@ then an attempt will
be made to dump ALL files. Interestingly, not only will .prg (etc)
files not be executed, they will also not be displayed as executables
on the desktop.]

If no other match is found, the top line wakes up the see/print
alert box that so incenses many people.
The simple solution is just to insert the name of one's favourite
display routine, as below. This will then ensure that any

non-executable is then read using the facilities of LESS, (thus ending
that sinking feeling, as the crucial paragraph that one was looking for
flashes off the top of the page.)
(Printing is best handled by a proper configurable printer spooler.

#F FF 04 d:\LESS.TTP@ *.*@
#D FF 01 @ *.*@
#G 03 FF *.APP@ @
#G 03 FF *.PRG@ @
#F 03 04 *.TOS@ @
#P 03 04 *.TTP@ @

In response to someones query about the desktop.inf.... tah dah -----
Everything you always wanted to know about desktop.inf, but were afraid to
ask. Below is a typical desktop.inf file (with a few changes added for
examples). Below each line is a definition of what each value represents.

#a000100
This is the first desk accessory, the rs232 config. Each 0 represents the
first column of buttons on the set rs232 config dialog box. The first
0 is column 1 row 1, the second 0 is coumn 1 row 2, etc. A 1 value
indicates that a button in the second column was chosen.

#b000000
This is the set printer config. It works the same way as the rs232 config.

#c77700070006000700552005055522207705570750555077031111103
This is the color palette. The color value is set using 3 digits at a time,
representing the red, green and blue values. The 3111103 at the end deals
with the keyboard repeat rate, and sensitivity. (None of the above three
will do anything if the associated desk accessory is not loaded)

#d
This is apparently reserved for a fourth accessory, and does nothing at
this time (so far as I can see).

#E C4 02 (#E=Extras)
This is two things. The first value has to do with both the Set Preference
dialog and the mouse double click rate. The byte is broken down as follows
with the indicated bit set performing the noted action:

Bit 7 6 5 4 3 | 2 1 0
Value 128 64 32 16 8 | 4 2 1
displays sorted sorted confirm confirm | double click rate
TEXT by by deletes copies | all three bits, values
(if not set size date | may only be from 0-4

displays \ / | 5-7 will turn off the
icons) both bits | mouse buttons
sort by
type

If neither bit 5 or 6 is set the sort is by name

The second value is 03 for hi rez, 02 for medium rez, or 01 for low rez.

#W 00 00 02 0B 2A 0B 08 A:*.*@ (#W=Window)
#W 00 01 0A 01 45 09 08 A:\TEST.C*.*@
#W 00 00 0E 09 2A 0B 08 A:*.INF@
#W 00 00 0F 0A 2A 0B 00 @
The above four are the window defs. The first number is how far over the horizontal slider is, the second is the vertical slider. The third number is the x coordinate of the left hand side of the window (this takes on even values, with odd values the same as next lowest even value). The fourth number is the y coordinate (this takes single increments). The fifth and sixth numbers are the width and height, respectively. The last number indicates where on the screen the window will open from. (The window opens with a different shape and from a different place with each number, but when

you close the window, it will go to another place on the screen. I have not hacked at this long enuf to figure it out.) A zero or FF will not open the window. The text indicates which drive's contents will be displayed. If the drive does not exist, the window won't open, ie. drive bits not set. Also, if the display validation is omitted, the window won't open.
The second def above will display the contents of the folder TEST.C, while The third def above will open a window, and only display the .INF files on drive A. If you close and open the window, the files will display as defined in the file and program defs below. (NOTE: this only applies to icon images, every file will display in text -- except if the file bits are marked to be hidden, system, volume, read/write and whatever other bits there are, in which case it won't display at all, but if it is read only, it will display -- strange HUH?) The bottom-most open window in the list will be the active window.

#M 00 02 00 FF D FLOPPY DISK@ @ (#M=iMage (?))
#M 00 00 00 FF A DRIVE A@ @
#M 00 01 00 FF B FLOPPY DISK@ @
These describe the icon attributes. The first two numbers are the column and row position of the icon. The column can be from 0-7, the row 0-3. The third number determines the icon image which will be displayed. The image number is the same for this and the remaining defs in desktop.inf, as follows:

0= disk drive (drawer) 1= folder (sub-directory) 2= trash can
3= executable file (.PRG, .TOS, or .TTP) 4= text (stack of papers)

The fourth value doesn't seem to do anything, but must be a place holder for an unimplemented function. The single letter is the drive identifier, and

the text is the drive name. The first @ indicates the end of the drive name.
The second @ does nothing, but we can speculate as described below for the
file identifiers. The order in the list determines the visual heirarchy
of the icons, ie. which will display on top when moved over another icon.

#T 00 03 02 FF BLACK HOLE@ @ (#T=Trash)
This is the same as the disk drive. If you move a disk drive identifier
below this in the list, it will display on top of the trash if moved to the
same location. The trash has no identifier letter, but you can put one in.

#F 03 04 @ *.INF@ (#F=Files)
#D FF 01 @ *.C@ (#D=Directories)
These two determine which type of file or directory will be displayed, when
displayed as icons. The first line will make GEM display only .INF files
for use with the SHOW, PRINT, CANCEL alert box. If you delete this line,
no icons will be shown for any file, except as defined below for programs.
The second line does the same for sub-directories, only .C

1979. TOS 1.4 Incompatibility List: Populous

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 18:49:26 UTC
From: colas@trinidad.inria.fr
Message-ID: <267@mirsa.inria.fr>

Yes, Most of the greatest ST games do not work with TOS 1.4: Populous, dungeon master, Falcon, Rick Dangerous...

At least there are some good news: It is only the PROTECTION on populous which crashes, my original do not work, but my cracked copy I have for everyday use works perfectly (I try never to use originals, as a power cut will fry the disk inside a ST drive...)

bad news: even the cracked versions of falcon and DM do not work.

O.K. I have both an answer and a question :
(hence the posting - I hope the info will be of use to some,
I hope that someone can answer my query.

The following code I wrote appears to work as expected :

It wakes up a desk accessory by sending it an AC_OPEN message.
Note :
first it uses appl_find to get the handle,
then writes a 16 Byte message to it;
for the accessory to actually get a chance to do anything
appl_yield must be called (Tos 1.4),
or event_timer with a delay of zero
- note 32 bits : event_timer(0) will crash. (I know !)

The format of the message depends on the message, but if the
standard event_multi is to process it should contain
between 6 and 16 Bytes : i.e. the first 3 ints must be present.
If it is longer, then appl_read must be used to process it.
```

My question concerns th 4th int in Mssg (a 1) : for AC_OPEN, this should be "the number of the accessory (on the menu bar)" - how do I establish this ? Is it the same as the acc_handle (also a 1) ? (An accessory only realy needs to check this if it is installing more than one entry on the menu bar.)

WORKS : (excuse mixed ints, Bytes)

```
wake_acc()

{
int acc_handle, res ;
int Mssg[8] = { AC_OPEN, handle, 0, 1, 0,0,0,0 } ;
acc_handle = appl_find("ANACLOCK");
res = appl_write(acc_handle, 16, Mssg );
evnt_timer(0,0);

}
```

Hope this helps people (if I have erred, please say - I have read what I can, but the sheer surprise when something like this works ....)

cheers
beau webber jbww.@ukc.ac.uk

P.S.

```
|
|I need to know what you ST users out there do when you're not using your
|ST. I have some friends who advocate leaving the computer and hardisk turned
|on, and others who say to turn them off. What do you guys do ?
|
|----------
```

The actual effect of turning the computer and monitor on and off is small enough to ignore. Electronics and crt's have come a long way since the days that it was uniformly recommended to leave equipment on all the time. In fact, unless you use a screen-saver, a modern crt will probably provide better service if you turn it off when not in use (to avoid phosphor burn-in).

But the hard drive is a different story. Like a car, acceleration and braking (e.g. turning it on and off) are what really causes the wear. Cruising at highway speed causes little wear! So, you do not want to be turning you hard drive on and off ten times day.

So, what I do is leave the computer on for the remainder of the day after I start using it. I use a screen saver, Neodesk has one, and so does MACCELLII.PRG which someone recently mentioned they were going to post. When I retire for the day, I shut it off (I hate the noise). I anticipate being able to buy a TT long before I have a problem!

> (I have an Epson-compatible; I'm just curious...)
Excuse all the garbage, but this is the first time that I've
contributed to this net. The answer to your question is yes, one can
substitute another driver for the default called up by Alt-Help. In
fact Tom Hudson published his program to do just that in the first
issue of Start. It steals the Alt-Help vector and allows the use of a
DEGAS printer driver (resident) instead. In Start magazine #3 Hudson
also published a DEGAS printer driver creation program that allows for
the creation of a lot of drivers. It might be tricky to use on laser
printers and almost certainly wouldn't work with the Atari laser.
Bob Pegram @uvm.edu

PS
Anybody ever figure out why Atari said the printer should be Epson
compatible, but it can only dump properly (correct linefeed size) when
in IBM graphics printer mode? (or do I have really strange early ROMs?)

For Sale or Trade for PC clone.

Complete Atari Package
-Atari 1040ST computer
features
800k DS drive internal capable of reading MS-DOS and TOS disks
mouse
1 megabyte of memory (1024k)
-Atari Sm-124 Monochrome Monitor
high resolution, fine dot pitch monitor
-20 disks of PD utilities, games, applications to start up with
some original, most PD.

computer is capable of fine MAC emulation -ith commerical package called
Spectre GCR and will emulate PC a AT speed with Norton SI rating of 3.0
with package called PC-ditto II. Excellent machine, these two packages
are not included.

Sell for 650 dollars or trade for PC clone or Dual standard USRobotics HST .

please contact the seller at his beeper

I sometimes have the same problem, only less frequently now that I am not using TURBODOS by Dominique Laurent and Atari France. I have Laser C 2.1 by the way. Does anyone have a program which works like TURBODOS but has less compatibility problems? I like it and until I get TOS 1.4 I could use a HD speedup program.

Anyway, my advice to you is to get rid of any memory resident programs which could possibly cause compatibility problems, such as ramdisks, speedup programs, etc. Especially if you are using the original NOV 20 1985 ROMS.

I have a different problem though - whenever I GOTO a line, I lose the mouse pointer... I can still do stuff with the mouse but I can't see where it is pointing. I sent MEGAMAX a letter telling them this and haven't gotten a response yet. This also happens with search/replace...

By the way, thanks to all who informed me that TUrbo C is available on the ST. Actually I knew this already, but there are two factors which prevent me from buying it.

1] The manual's in German and I don't know German.
2] It is TC 1.1 and does not include a SLDB which I really use a lot on Laser C 2.1

Once it is available on this wonderful continent of ours (tounge in cheek, please note), and if I don't get any results from Megamax, Inc. I plan to TRASH this damned compiler and go Borland all the way (I hope someone from Megamax is reading this - I need SUPPORT - that is what I pay $$$ for, and you just got another $50 from me last month for the new version, so I expect results....)

1991. ST Flowcharting program wanted

Newsgroup: comp.sys.atari.st
Date: 1989-10-24 22:02:17 UTC
From: covertr@force.UUCP
Message-ID: <466d0f07.14a1f@force.UUCP>
Source record: 247962

This message is really meant for folks over in England
or Europe.

Does anyone know of a good flowcharting CASE type program
for the ST?? I want something that I can use to make flowcharts
in high rez (using the ST monochrome monitor) and then print out
on the Atari SLM804 laser printer. Even a GDOS based program
would be acceptable as I have a 4 meg Mega st. I program in C
and really need something like that. A program to gnerate data
flow diagrams would be nice also.

I read in a UK magazine about such a program, but my local dealer
hasn't been able to get any info about it.

Please post the program name, features, and publisher so that I
can buy it.

If there isn't a ST program, does anyone know of a Macintosh program
that would work on the GBS Spectre software?? and that generates PostScript
output files (the only way to get decent printouts on the SLM804 with
Spectre is to dump them as PS files and then export them to ST, and then
to print them out with UltraScript.).

Thanks very much.

Richard Covert

Message-ID: <1989Oct24.231605.26688@agate.berkeley.edu>
Source record: 247964

Is there a printer spooler that operates like the unix printer spooler:
it prints all the files in a directory, sequentially by date/time. With
a hard disk, this could be a better spooler than one that eats up a chunk
of RAM and doesn't support queueing and de-queueing (via file deletes).

A somewhat related question: How does GEM feel about TSRs and ACCs opening,
using, closing, and deleting files? I've read that they should not do such
things. What about file buffer space: is there a way to increase the number
of files allowed open?

> 1.4 to come in.

Your dealer is on bad drugs. There is only one official, released version of TOS 1.4. Any others are "beta-test" or "developer" releases, and as such are not supported by Atari. (Besides, the fact that we came out with the final release after these implies that there were things that needed fixing - do you want a (more) buggy version?)

The date in the OS header of the released version is 4/16/1989. You can see the date if you dump four bytes of memory starting at $FC0018; the date shows up as 04 16 19 89 in hex (for the right version).

I don't like Mega ST pricing either. But you could as well upgrade your Atari 1040ST to 4 megs. I guess it wouldn't cost you more than upgrading a 1 MEG Mac to 4 MEG. It's only the memory chips that cost. Were the prices for the ST-system street prices? If they were, the comparison makes no sense. You should then have chosen street prices for the Mac-system, too.

I don't know about Rick Dangerous, but I've been playing Dungeon Master
and Falcon with no problems on my system with the 1.4 ROMs installed. I
also play off copies, not the originals, but these disks haven't been
cracked. The big reason for copying these was that the original disks
couldn't be read on my machine. (Funky drive speeds.)

I've also been playing Operation Counterstrike (the Falcon Mission disk)
without any problems.

1997. Why Atari?

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 01:08:48 UTC
From: JALKIO@cc.helsinki.fi
Message-ID: <1109@cc.helsinki.fi>
Source record: 247968

I just want to tell you why am I using an Atari.

First of all, it is supported enough for my usage. There are some options for almost every application. There are much more programs and hardware devices to choose from in the PC-world, though. The reason for why I haven't got a PC is that I'm used to my system. I think the operating system is effective and robust. I guess many people get used to their own system and it is hard to change the hardware completely. This leads to many flames. Some flames are resonable, though. If somebody makes a non-objective comparison, for example, I think it should be noted (whatever the computer)!

Another reason for having a ST is the MIDI. I'm making music with synthesizers. ST is the cheapest and the most reasonable computer for MIDI-usage (at least I think so).

Third: When I bought my ST, it was at least three times cheaper than a comparable Mac. I don't know about the US prices, but the situation is still much the same here in Finland. AND if the TT will cost 1300 pounds, it will be quite a bit cheaper than a comparable Mac. (Well, the Finnish prices are high for all computers. I bought my ST from England. It should have paid twice the price if I had bought it from Finland).

Fourth: You can get very nice emulators for the ST. There are now two usable PC-emulators and two usable MAC-emulators.

I have notified, that ST's are most supported in Germany. I have subscribed a German ST-Magazine - they make lots of different devices and programs for the ST especially in Germany.

By the way, I think that the US ST-magazines aren't very good. What do you think of them? At least they have only few serious articles.

1998. computer purchase decision

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 01:12:24 UTC
From: brandonl@amadeus.WR.TEK.COM
Message-ID: <519@wrgate.WR.TEK.COM>
Source record: 247969

Well, after examining the response to my MIDI question, the general
chatter in the comp.sys.atari.st news, and, more than any other single
person, Richard Covert, I have decided *not* to buy an Atari anything.

Atari has had its head stuck [...] since before I used to sell the 800/400's
eight years ago. I have no doubt that there are innovative people working
at Atari, but the _machine_ that is the structure of the company is slow,
inefficient, and lacks focus.

BUSINESS__
Atari will *never* be considered a business computer. They shouldn't attempt
to wear that label. They could, however, actively `interface' with what's
going on in the business world in order to support those users who require
both what the Atari is good at, as well as business-type applications (e.g.:
spreadsheets).

Atari has a name for games; an arena they've been thrown out of by Nintendo.
Atari has a name for graphics, though not quite as good as Amiga, & Mac II.
Atari has a name for sound. MIDI built in is a nice feature, but unless this
is your exclusive use, there are better systems out (even in terms of
cost-effectiveness). These shortcomings can all be overcome, though. TT? ATW?

THE_CRUX__
What Atari also has a name for (over 8 years) is poor support, both for the
users/developers, and the stores who sell their products. Let's focus on the
business & marketing people, as well as whatever Tramiel is `in charge'. This
general area is where the heart of the problem lies. And frankly, yes, I do
think I could do better. Judging from the talk here, so do many others.

Marketing has done a very bad job. With no focus, what is their target?
It is possible to design and build a wonderful, wonderful system, but the
engineers don't decide what to build. That's under the direction of the
upper echelon.

RECAPPING__
Well, I didn't want this to be a novella. I just thought a better focus
for criticism (well deserved) would be the "decision makers."
Simply put:

Atari,

You blew it.

dftsrv!iris613!stailey@ames.arc.nasa.gov (Ken Stailey) writes:
> The only good FORTRAN is a dead FORTRAN.
I don't like FORTRAN very much either, but, after working with it for almost a year, I have come to realize that there are reasons why it still survives today. It is a very powerful tool for numerical work (COMPLEX type, different precision for sin, cos ect. (am I flaming C? Perhaps I am)), and if one maintains strict programming discipline, it is possible to write structured and legible code in it. It is possible to write useful and portable programs within the standard (something that still has to happen to C), and there is a huge amount of numerical software written in it. It is also inelegant and bug-prone in certain areas (array passing, COMMON blocks, few control statements), but a good compiler can help a lot with that.
(I didn't start working with FORTRAN on my own accord, but because I had to - working on a IBM mainframe for which there IS no other decent compiler here at the computer center).
In reply to the question about FORTRAN for the ST: I heard that Prospero FORTRAN is very good (it implements the full FORTRAN77 - standard), but I haven't tried it myself yet.

I do have an honest-to-goodness question about the elusive TT. Since users are paying all that money to get a 68030 box, can it multitask? Seems to me that if it doesn't it is just a speedy ST in a new box. Enquiring minds want to know....

Oh yeah, I think Richard Covert mentioned that he still was an avid ST fan, but would never buy another Atari product. I would put myself in the same class (except never should be all caps -->NEVER). Some of us are willing to pay a wee bit extra at the outset for a PC rather than having to fight tooth and nail for even the most meager (OK...nonexistent) support. Just an observation. I still like my ST (er, well I guess I still like my 15 year-old cub scout uniform too <grin>).

Chris

Well, there are whiners in every bunch.

I personally must say that I knew what my ST was when I bought it, it has performed as I expected, and I think I am getting my money's worth.

Your mileage may vary.

2002. lettahed

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 04:10:50 UTC
From: ljdickey@water.waterloo.edu
Message-ID: <2718@water.waterloo.edu>
Source record: 247973

Over the net recently came a program called "lettahed", which would take an image file with extender ".IMG" and insert it into any text file, just about anywhere.

Maybe I did something wrong, but I installed the accessory on my hard disk, and had no end of trouble. When I tried to boot my system, I got into an infinite cycle of re-booting, with something, somewhere, asking me to insert disk B into drive A. Since everything else had been working well with one another, all the programs in my BOOT program, and the addition of this accessory seems to be the thing I did that caused me the grief.

I had to take emergency measures. (turn off the hard disk, boot with a certain disk in my floppy drive, turn on the hard disk, run the ICD boot program, install icon, etc. ... a big pain.)

When I changed the name of the accessory from "LETTAHED.ACC" to "LETTAHED.AC", my problems went away. Do you know? is this program incompatible with hard disk systems?

I could some kind soul supply the pinout functional assignment on the
circular connector to an atari sc1224 rgb monitor.
The atari stores do not seem to have this information.
I need to know which pins are H and V sync, and the pins which are
R,G,B analog and/or TTL inputs.
Please email response. Thank-you!

2005. It's Back! A Substantially Revised Picture Formats List

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 04:59:26 UTC
From: dmb@TIS.COM
Message-ID: <8910250500.AA19110@TIS.COM>
Source record: 247976

Since there have been some inquiries about picture files, here's the
latest version of "The List". If you have an old version of this,
I strongly suggest you take this new one. Major corrections have been
made to:

NEOchrome (color animation info in header was _completely_ wrong)
DEGAS compressed (bitplane ordering was wrong)
Tiny (complete rewrite of compression scheme description)

I have fully tested NEO, DEGAS (all variants), and Tiny, so I'm fairly
sure these are correct now.

Those of you who have been kind enough to upload this list to archives,
please replace the old crusty versions with this one (oh, and THANKS).

NEOchrome NEOchrome Animation DEGAS
DEGAS Elite (Uncompressed) DEGAS Elite (Compressed) Tiny
Spectrum 512 (Uncompressed) C.O.L.R. Object Editor Mural MacPaint
Spectrum 512 (Compressed) Animatic Film

Introductory Information
----
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

```
Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special
information there (most notably Art Studio).

The Formats
-----------

<NEOchrome>

1 long resolution (0 = loew res, 1 = medium res, 2 = high res)
16 words palette
12 bytes filename (usually " . ")
1 byte unused (usually either 80 hex or 0)
1 byte color animation limits (4 most significant bits are
left/lower limit; 4 least significant bits are
right/upper limit).
1 byte color animation enabled? High bit set if yes.
1 byte color animation speed and direction
x = 0 means animation stopped
x < 0 means colors cycle to the left (decreasing)
x > 0 means colors cycle to the right (ascending)
Number of vblanks between cycles is |x| - 1
19 longs reserved for expansion
16000 words picture data (screen memory)
-----------
32128 bytes total

<NEOchrome Animation>

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click the both mouse buttons in the eye of the second R in
the word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of image in bytes (always divisible by 8)
```

```
1 word height of image in scan lines
1 word size of image in bytes + 10 (!)
1 word x coordinate of image (must be divisible by 16) - 1
1 word y coordinate of image - 1
1 word number of frames
1 word animation speed (# vblanks to delay between frames)
1 long reserved; should be zero
--------
22 bytes total for header

? words image data (words of screen memory) for each frame, in
order

<DEGAS>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
-----------
32034 bytes total

<DEGAS Elite (Uncompressed)>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]
-----------
32066 bytes total

<DEGAS Elite (Compressed)>

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control bytes
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]
-----------
< 32066 bytes total
```

Control byte meanings:

For a given control byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-127 <= x <= -1 Use the next byte -x + 1 times
-128 No operation (ignore)

Compression Scheme:

Each scan line is compressed separately; i.e., all data for a given
scan line appears before any data for the next scan line. The scan lines
are specified from top to bottom (i.e., 0 is first). For each scan line,
all the data for a given bit plane appears before any data for the next
higher order bit plane.
To clarify: The first data in the file will be the data for the highest
order bit plane of scan line zero, followed by the data for the next lower
order bit plane of scan line zero, etc., until all bit planes have been
specified for scan line zero. The next data in the file will be the data
for the highest order bit plane of scan line one, followed by the data for
the next lower order bit plane of scan line one, etc., until all bit planes
have been specified for all scan lines.

<C.O.L.R. Object Editor Mural>

16000 words picture data (screen memory)
(palettes are stored in separate files)

32000 bytes total

<Tiny>

Several people have reported sightings of mutated Tiny pictures
that do not follow the standard format, so let's be careful out there.
What is described here is the format David Mumper's original TNYSTUFF.PRG
produces.

1 byte resolution (same as NEO, but +3 indicates rotation
information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits
hold left (start) limit; low 4 bits hold right (end)
limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

```
-------------
42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not simply screen memory bitmap data; instead, the
data is divided into four sets of vertical columns. (This results in
better compression.) A column consists of one specific word taken
from each scan line, going from top to bottom. For example, column 1
consists of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
The columns appear in the following order:

1st set contains columns 1, 5, 9, 13, ..., 69, 73, 77 in order
2nd set contains columns 2, 6, 10, 14, ..., 70, 74, 78 in order
3rd set contains columns 3, 7, 11, 15, ..., 71, 75, 79 in order
4th set contains columns 4, 8, 12, 16, ..., 72, 76, 80 in order

Note that Tiny partitions the screen this way regardless of resolution; i.e.,
these aren't bitplanes. For example, medium resoltion only has two bitplanes,
but Tiny still divides the medium resolution pictures into four parts.

<Spectrum 512 (Uncompressed)>

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)
-----------
51104 bytes total

<Spectrum 512 (Compressed)>

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map
```

```
--------------
< 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme,
similar to DEGAS compressed and Tiny. The data map is stored as a
sequence of records. Each record consists of a header byte followed by
one or more data bytes. The meaning of the header byte is as follows:

For a given header byte, x:

0 <= x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x < 0 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included; i.e., stays
the same). The least significant bit of the bit vector refers to
palette entry zero, while the most significant bit refers to palette
entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette
entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the
background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).
Yes, it is hideously complex.

<Animatic Film>

1 word number of frames
16 words palette
1 word speed (0 - 99; value is 99 - # vblanks to delay between frames)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse
1 word width of film in pixels
1 word height of film in pixels
1 word Animatic version number (major)
1 word Animatic version number (minor)
```

```
1 long magic number 27182818 (hex)
3 longs reserved for expansion (should be all zeros)
--------
32 words total for header

? words image data (words of screen memory) for each frame, in order

<MacPaint>

Word has it that this is wrong. Someone please send me a correction!

header {
1 long version number (if zero, entire header is ignored)
38 * 2 longs pattern data (anyone know how to use this?)
83 longs reserved
} (total 160 longwords for header)
< 51200 bytes compressed bitmap data
-------------
< 51716 bytes total

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image.
The data is stored as a sequence of records. Each record consists of a
control byte followed by one or more data bytes. The meaning of the
control byte is as follows:

For a given control byte, x:

0 < x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= 0 Use the next byte -x + 1 times

There are 72 bytes per scan line. Each bit represents one pixel; 0 = white,
1 = black.

I don't have this quikinf.prg. Anybody know where I can get it? Now on to
my main question:
I want to load up Empire by clicking on a save game and have that game
loaded into my ST. I've used the 'Install Application' and Saved the Desktop
and gotten the *.EMP file to load Empire. However, the .EMP is not loaded
into the game and I have to use the load saved game option in Empire. Is
there something I'm doing wrong? Or can I not load saved games like I'm
trying to?

Has anybody seen or heard anything about Empire II? What's the latest version
of Empire I (mine is 2.05C)?

Actually it is a variant of certain Protestant views that since Sunday is the new Sabbath, then Monday should be the first day of the week. I remember seeing in my childhood a few calendars that started that way. I don't know precisely which groups promote that view.

Yep, if the mech has an ST506 interface, an appropriate controller (I got an Omti) and the usual ST DMA->SCSI adaptor card will give a viable drive. The Omti controller which I use is an RLL controller, small speed tradeoff for greater storage space. I got my gear from an ICD kit supplier in the U.K.

2010. Ham Radio Software for the ST

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 08:14:16 UTC
From: D.Wade@sysd.salford.ac.UK
Message-ID: <25.Oct.89.09
Source record: 247981

I understand that the KA9Q TCP/IP software has been ported to the ST. Can any one point me to a site accessible from BITNET with a copy of this port. I would also be interested in any info other Ham Radio Programs for the ST. Also does any one have any information about 6809 emulators for the ST. Some time ago a company in England advertised one for use under OS9/68K (I think) but they appear to have sunk without trace.

Sorry no signature file but replies outside the UK may be sent to:-
D.WADE@D.SALF.AC.UK - Most Places, MS2@UKACRL - Bitnet.

I have heard that falcon was only code-wheel protected in the US, is this true? (in europe the protection is disk-based...)

In fact I have not the roms installed, Our local ST shop owner told me that populous, DM, falcon, etc... did not work on his newly received STe, so I checked it at home with my disk-based version of Tos 1.4... So maybe these programs are only affected by the memory resident TOS? (I am ready to believe that with falcon, since it doesn't support disk caches anyways)

Anyways, I am more than ever convinced that words-in-documentation IS the best way (for the user) to protect games...

I think that the Mega ST's are the worst ataris in price/performace this
far. BUT, I have understood that Atari isn't going to make any totally
non-affordable business stuff. "Power without the Price". I'm judging a
computer's value as a private user. (You can represent the business
world, of course.)

And why hasn't Apple made any Top Of The Line (and Top Expensive) super-
computers for the bosses' desks?

>
>My question is: is there a way to specify all files except PRG, APP,
>TTP, TOS?

The Desktop parses the DESKTOP.INF file in REVERSE order, that's why it appends all the installed apps to the end of the file. So to do what you wish to do, place the #F FF 0$ C:\BIN\FILESPY.PRG@ *.*@ line at the very beginning of the program list before the executables. For example:

#G 03 04 C:\BIN\TEMPUS.PRG@ *.*@
#G 03 FF *.APP@ @
#G 03 FF *.PRG@ @
#F 03 04 *.TOS@ @
#P 03 04 *.TTP@ @

would allow files with the extensions APP,PRG,TOS and TTP to be executed and all others would call TEMPUS.PRG. One note if you do do this, if you call an GEM editor that has a resource file from a different directory that the current working directory GEM will NOT find the resource file. The only way around this is to have all of your resource files in the root directory of your boot device(* Ugh!*).

2014. Which filehandle for stderr?

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 11:07:38 UTC
From: piet@cs.ruu.nl
Message-ID: <1739@ruuinf.cs.ruu.nl>
Source record: 247985

Which filehandle should be used for stderr? I have seen compilers that use 2 and others that use -1.

If you use 2: you can redirect stderr, but it is not official TOS usage (2 is supposed to be stdaux). So you need a sheel that sets up 2 to default to the console. On the other hand it is Unix compatible.

If you use -1: it is TOS standard, compatible with the desktop, but you can't redirect it to a file.

So either way you seem to lose.

What are your feelings about this?

2015. re: TT vs 386 (= DOS vs **IX ?)

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 11:08:24 UTC
From: emmo@moncam.co.uk
Message-ID: <285@marvin.moncam.co.uk>
Source record: 247986

I really can't resist throwing in my twopenn'th.

My first encounter with a *real* operating system was U*IX on a
PDP11, just a few years back. Sure it's a steep learning curve,
but it's nothing compared to trying to make sense of a PC, as
I'm obliged to do now, and how anyone can be enthusiastic about
a system which is inherently single-tasking (ignoring single-user,
which isn't an issue for most DOSsers) is beyond my ken.
Surely even the most devout advocate must realise that MeSsyDOS is
DEAD, even if it does refuse to lay down.
I'd put my money on a machine which can convincingly emulate DOS &
Macs and probably do it as tasks under a U*IX system, but having
read this newsgroup for a few months now, I've decided not to waste
my time waiting for the TT, I HAD to have MeSsDOS by Feb '90.

Atari take note: the complaints of your UK users are losing you
potential customers! - This one at least. The TT sounds like just
what I wanted, I like the 680x0, needed full DOS compatibility, but
didn't want to be confined to it, and I insist on being able to add
third party boards to a reasonable degree. Fine, but I also expect
to see some OFFICIAL support, if it were not for the efforts of Mr
Pratt et al, your reputation would approximately equal that of
AaaghhnottheMSTRAD! In the view of those who don't have access to this
excellent newsgroup, it may aready be worse.

Ask not for whom the bell tolls.......

From article <466bd5b7.14a1f@force.UUCP>, by covertr@force.UUCP (Richard E. Covert):
>
> Yes, the SLM804 is a CHEAP laser printer. And that is it only marketable
> feature. NOTHING has been done by Atari to support the SLM804 in over 18
> months. No new Diablo 630 Emulator, no Epson Emulator, no new GDOS driver,
> no new anything. And don't bring up UltraScript because that wasn't written
> by Atari. US was written by Imagen, bless them!!
>
I agree that Atari should have done more to support the SLM804. We
still can't get the Diablo emulator to install the 'bold italic'
typestyle for the main ATTP10LS font. It's not for want of trying,
but maybe it's for want of documentation. There again, maybe not. We
installed the WordPerfect printer driver for that font (see below) and
configured the Diablo emulator just like the WP docs told us to, and
we still can't get bold italics. There is now an Epson emulator
available in the UK (marketed by Atari UK who of course sat on it for
months then released it with an obsolete First Word Plus printer
driver with comments in German!), and it's not bad, though far from
perfect. I don't have time to create a proper condensed font for it,
for instance, and the default font set doesn't contain one. Still,
I'm sure some kind soul in PD-land will put together a good font set
soon.

> Ah, Word Perfect. Did you know that WP dropped development of the ST version

> WP?? that's because of all of the bugs in the SLM804's Diablo Emulator,
> which of course hasn't been updated in over 18 months!! So, WP dropped
> the SLM804. And it looks like Atari has also!!
>
Hold on Richard - that's not quite correct. A month ago I might have
agreed with most of what you said, but we just received (had to hassle
for it, mind) the August 1989 version of WordPerfect ST, and it has
TWO drivers for the SLM804/Diablo and one for the SLM804/Epson
emulator (called by its original German name, Laserbrain, in the WP
printer definition file). The new readme file also states that WP
Corp are continuing to work on WP ST, and that users should send in
requests for new features. Don't get too excited - I believe there's
only one programmer assigned to the ST (his name is James Marshburn,
according to Larry Rymal, who writes on this net and probably has more
details) and I don't expect to see WordPerfect v5 for the ST.
However, WP ST is not dead yet.

Apologies if I've been talking about some things that are not
available in all places where STs are sold. International software

distribution is one of the great mysteries of life.

Despite the fact that I've said some rude things about Atari UK recently, I still like using the ST. It's just a shame that it's never really lived up to its potential - development has been just too little, too late.

Graham

> drives read it?

"Twister" is a formatting technique developed by Dave Small and Dan Moore for STart magazine. It normally uses ten sectors per track, while the standard desktop format is nine sectors per track. That is OK for most disk applications, but be careful of disk-to-disk copies. They may not work correctly if both disks are ten sectors, and will certainly fail if only one is ten sectored (unless you are using a very smart copy utility). Other than that potential problem, all drives I've ever heard of can read and write ten sectors reliably.

>
> 2) I have both the Atari single-sided and double-sided drives. Both
> of these drives allow me to format up to 82 tracks, but they can't

> format out to 82 but only read up to 80? I'm confused. If I
> formatted with Twister, could I read up to the 82nd track?

While some people believe in cramming every bit of data they can onto a disk, I don't. You're playing with fire, and will eventually get your just rewards.

You may not really be getting 82 tracks formatted, the software may just think you are. The drives used in these machines are spec'ed to provide reliable service for 80 tracks. If the head stepper is capable of stepping beyond the proper range for one or two more tracks, that is a quirk, not a designed, reliable, or industry-wide standard feature. It may not be true of a drive mechanism used to replace the current one in event of a failure, or even of the same drive after servicing and alignment. In two drive systems, one drive may be able to reach 81, or 82 tracks, while the other may not.

Formatters (generally speaking) write a track, then read it back to verify it has no errors. They can only tell that what they just wrote is valid. If your drive can step to 80 tracks, but not 81, the formatter acts this way:

1) Format and read back the first seventy nine tracks (while these are really tracks 0 - 78, we'll refer to them as 1-79 to keep the details understandable).

2) Step to track 80. Format it, read it back, and it reads OK.

3) Step again. The drive head may not be able to go in another full track. It may not have moved, may have moved part of the track width, or may have moved a full track width. The software doesn't know that anything may be in error.

4) Format and read back track 81. This will appear to be OK, since the drive lays down the track where it is currently positioned. That may have partially or completly obliterated track 80, or may not, depending upon the distance the head actually moved.

5) Do this again for track 82. Again, track 82 appears to be valid. It may have destroyed track 81, which may or may not have destroyed track 80.

The upshot of al this is that the formatting software thinks it has written 82 valid tracks, while reality may be that you have 80, 81, or 82 valid tracks. The last track (82) will be valid, but 80 or 81 may have been corrupted in the process. That will result in write and read failures when the disk accesses those final tracks.

To determine whether you really can step to 81 or 82 tracks, you'll need to fill the disk with data, then read back the last few files.

I'd suggest you forget tracks 81 and 82. If you opt for ten sectors per track, just be careful of disk-to-disk copying.

Now, one more thing that "Twister" pioneered - sector skewing. The original desktop formatter (and most 3rd party formatters) always wrote the sectors on a track in 1-9 or 1-10 sequence, starting with sector 1 (yes, sectors are numbered from 1, while heads and tracks are numbered from 0. Don't ask!) Dave and Dan figured out that after writing sector nine on one track, the drive stepped to the next one, waited a brief time to be sure it stopped moving, then started looking for sector 1 to read or write. But, it had passed by, so the drive had to wait one disk revolution for it to come by again. They figured out that the time required for the head step and settle was greater than the time it took to pass one sector, but less than two sectors. So, they "Twisted" the sectors on each track. If the sequence of sectors on track 0 is 1 2 3 4 5 6 7 8 9, then they put the next track (either head 1 of track 0, or head 0 of track 1, depending upon whether the drive is double sided) in the order 8 9 1 2 3 4 5 6 7. That way, just as the head is ready to start looking for sector 1, it comes along.

ST's with ROMS prior to TOS 1.4 format all tracks in 1-9 order. Beginning with TOS 1.4, the sectors are "Twisted" in the same manner by the desktop formatter. The TOS 1.4 formatter also writes a boot sector compatible with MS-DOS, so you can interchange ST and IBM disks. Be careful, however, of formatting lots of disks on MS-DOS machines, and using them in STs. MS-DOS doesn't put serial numbers on disks, and the ST depends upon them to tell when disks have been changed.

> 3) Are there any 3rd party drives that support 1.4M disks? By
> suuport I don't mean that they will format them to 800K but to the
> full 1.4M mark.

None that I know of. 720K and 1.4M disks rotate at the same speed. To achieve the higher capacity, the rate at which data is transferred is doubled. This requires hardware modifications inside the ST.

>In conclusion, I'd like to state that I'm sick of all the TT/386/Apple
>bashing. Let's stick to ST information, etc. for a while.

AMEN!

Uh, just a small nit. I believe the list-price on the LJ IIP is $1495, though
I don't doubt the "street price" could approach your figure.

2020. Atari Word Perfect

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 13:13:54 UTC
From: chad@norge.dec.com
Message-ID: <1575@hiatus.dec.com>
Source record: 247991

Note concerning WP:

Recently I received a major upgrade to my atari WP. This upgrade had to be ordered and the cost was 10 or 15 dollars for the media and shipping (several disks were involved). The cover letter mentioned that WP was still going to support the ST in the future.

I don't know if this is just marketing or not.
Take it as you will.

Chad

2021. GEM messages --- longer messages

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 13:58:57 UTC
From: haacke@exunido.uucp
Message-ID: <1693@laura.UUCP>
Source record: 247992

```

>However if appl_find is given the name of the current process then this
>code works fine.
>
>It is not the desk accessory that is at fault as it works perfectly with system
>messages sent by the AES.
>
>Anyone tried anything similar at any time?
>
--------------------------------------------------------------------------------

In the first three WORD of a GEM message must be present 'internal message-id',
'GEM-id of the sender' and 'length of the "full" message - 16'.

For your PROGRAM:
int appl_id; /* Application-id */
int msg[100];
:
ap_wid = appl_find("MYACC ");
gets(message);

/* Thas new !!! */
msg[0] = 1024; /* internal message-id */
msg[1] = appl_id; /* I'm sending this message */
msg[2] = strlen(message)-10; /* add 6 for administration-bytes (0..2)
sub 16 for bytes in msg-buffer */
msg[2] = msg[2]<0 ? 0 : msg[2]; /* No negativ numbers !!!!! */
strcpy((char*)&msg[3], message);

/* And now your program */
appl_write(ap_win,msg[2]+16,msg);
evnt_timer (1000,0); /* Wait a moment for the accessory to
receive the message */
:
```

The ACCESSORY:

```
int msg[8];
char out[200];
:
evnt_mesag(msg); /* get a message */
if (msg[2] != 0) /* more then 16 Bytes transfered */
{
/* save the first bytes (WORD:3..8) */
memcpy(out, (char*)&msg[3], 10);
/* add the rest of the message */
appl_read(acc_id,msg[2],&out[10]);
/* end the string */
out[10+msg[2]] = '\0';
puts(out);
}
:
```

I hope this can help you.

Do you mean that are subscriptions will come to a screeching halt, or are they merely combining Analog with their ST mag (STLOG?) similarly to what ANTIC is doing? I suspect that both magazines are combining their 8 bit and 16 bit coverages into one magazine and that both will go to disk only subscriptions.

2024. UK prices for hardware

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 15:42:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8910260701.AA00703@ucbvax.Berkeley.EDU>
Source record: 247995

I was E-mailed the following info from "Mathew" in the UK.

```
System 1 System 2
-------- --------
Mega 2 Mac SE, 2MB
SM124 20MB hard disk
20MB Hard disk Er...
DTP software that's it.
Atari laser
---------- ------------
2000 pounds sterling 1640 pounds sterling
```

Please note that the quoted price for System 1 is street price, whereas the quoted price for System 2 is educational discount price (45% off!). Now, if we add the laser printer and some cheap DTP software to System 2...

Now, why do you think there are thousands of STs in Europe and virtually no Macs?

Feel free to post the above (I can't post to the net).

Well, folks the Fall COMDEX is only 3 weeks away. Comdex
is being held in Las Vegas around the 16th of November.

Does anyone want to place any bets on what Atari will be
showing at Comdex??

will Atari have the NERVE to show the following VaporWare:

1) any flavor of the TT

2) the 1040STE

3) the Lynx game

4) DESKSET II

5) UNIX Sys V with X Windows

6) Word Flair (remember that one, supposed to blow away Word Perfect)

Well, I am looking forward to Comdex. I just *LOVE* VaporWare, its
so much cheaper then HardWare or SoftWare!!

Rich Covert

********** GOOD NEWS SECTION **********
This time I would like to recommend MultiDesk from
CodeHead Software. Charles Johnson is the one bright
star in the ST universe and MultiDesk is marvelous.
MD allows you an unlimited number od DAs. It runs as a
DA and has menus to allow you to bundle different groups
of DAs and load them. And it works with the SLM804 Diablo
Emulator. A great utility if you use a lot of DAs.

There may be international standards around, but if you want your software
to be _culturally_ acceptable, you'll find a lot of variability.
Generally, Europe puts Monday first, U.S. puts Sunday first, the
Middle East put Saturday first. There are probably other variations; I
would imagine that Asian cultures would have a different outlook on things.

Monday is first; in the U.S., its us

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

STlog and Analog will be merged into one mag. Analog was the best Atari mag out there - and STlog was good too. I haven't read Analog in years but STlog went down the toilet (IMHO). Bad magazines just waste advertising dollars that good magazines could use to become even better. I hope they go under and Larry Flint loses money.

2031. Two-page Atari advertisement!

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 16:36:38 UTC
From: pgs@cs.brown.edu
Message-ID: <18873@brunix.UUCP>
Source record: 247802

I opened my copy of The Brown Daily Herald, our campus newspaper, today and discovered to my amazement a 2-page advertisement for the Atari Portfolio. I will attempt to describe it.

A thin black banner appears at the top of each page, inside of which is printed in white "INTRODUCING THE PORTFOLIO COMPUTER BY ATARI". In large type on the top of the left page, under the black banner, appears "Now the power of a laptop comes in a handy new size." Underneath is a photograph of an open Portfolio computer, held in someone's hand. Beneath the picture are some stats about the computer:

128K continuously powered internal RAM, externally expandable, and 256K internal ROM with DOS, BIOS, and applications.

256x64 pixel graphics mode, 40x8 text mode (With a moveable window on 80x25 character display.

80C88 static CMOS processor runs at 4.9152 MHz.

Super-twist LCD screen.

Includes 5 applications:
- spreadsheet
- word processing
- telephone/address directory
- diary
- calculator

Measures 7.8" x 4.1" x 1.2". Weighs 15.87 oz.

Built-in 32-pin connector for RAM/ROM memory cards (replace floppy disks for storing data and programs)

63 positive-actions keys with audible click feedback and familiar QWERTY keyboard.

60-pin expansion bus.

At the top of the right-hand page reads, "Slip it in your backpack and take it to class!" A small photo of the Portfolio being slid into a backpack appears beneath, around which a large amount of text appears. It reads:

Introducing the first PC that fits in your palm and weighs less than a pound.

Imagine-- as easily as reaching into your backpack for paper, you could be pulling out a computer instead!
Introducing the Portfolio by Ataru. It weighs less than a pound. Its system commands are MS-DOS compatible. And it costs a fraction of what you might

expect. At about the size of a paperback book, it fits right in the palm of your hand. You might call it a "palmtop."
Take it to class with you... or to the library... or on the plane ride home. It's so small and light, you'll forget it's there. And you'll be able to write papers, review your notes, figure math problems-- almost everything you'd do on your home computer!

Five vital applications include-- even a spreadsheet.

The Portfolio comes complete with five important applications. You can upload and download your Lotus 1-2-3 files into the 127-column-by-255-row spreadsheet. Take notes and write papers on the basic word processor, then upload them as ASCII files into WordPerfect of other word processing software if you have a desktop computer. You'll also have a phone/address directory (with RAM cards, hold virtually unlimited numbers of addresses!) with phone autodialer, an appointment calendar and a calculator with an editable tape of calculations right at your fingertips. Menus and messages can be displayed in English, French, or German.

Run for weeks on three AA batteries.

Unlike other portables with power that lasts a few hours (about half a study session), the Portfolio gives you four to six weeks of typical use with three standard AA batteries. And you'll never have to lug a heavy Ni-Cad battery with you. You can easily change batteries without data loss. Three AA Duracell batteries are included with your purchase to get you started!

Connect this palmtop to your home computer.

A whole system of peripherals expands this palm-sized marvel to something even more remarkable-- a complete "mini-office" for students on the go. Once you're back at home, upload your work into your home computer. Or print it out on your printer. Because the Portfolio uses MS-DOS-compatible commands, many popular PC software programs are now being adapted and will soon be available to Portfolio users.

Call now-- and hold the Portfolio in the palm of your hand.

Take advantage of our "try-me-free guarantee." Order your Portfolio today and keep it in your pocket, purse, or backpack. If at the end of 30 days you don't think this is the most vital study tool you've ever used, simply return it for a full refund.
Don't wait another moment. Call toll-free (800)443-8020 today. All orders are shipped Federal Express for quick delivery. The next time you reach in your backpack, you could be pulling out your Portfolio.

---- Peripherals and Accessories ----
* Smart Parallel Interface. Interface to parallel printers and exchange files with PCs. Includes file transfer software for IBM PC and compatibles. $49.95
* Serial Interface. Standard and complete RS-232C interface for modems, printers, and other serial devices. $79.95

* RAM Memory Cards: 32K $79.95
64K $129.95
128K $199.95
* AC Adapter $ 9.95

A "coupon" reads the following:

YES! I want the Portfolio by Atari now.

JUST $399.95

(miscellaneous ordering information for mail orders)

Order toll free: 800-443-8020
7 am to 5 pm (PT)

And at the bottom, the ATARI fuji logo, with the words ATARI COMPUTER next to it, and beneath, "A computer for everyone."

Thought people might be interested.

2032. Re: FORTRAN

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 16:39:26 UTC
From: ron@gsbmva.uchicago.edu
Message-ID: <5984@tank.uchicago.edu>
Source record: 247803

It is pretty funny reading messages about programmers bashing FORTRAN. There are computer languages that are better suited for some tasks than other computer languages. To say "FORTRAN stinks!" or " C is for techno-geek-wimps" is silly. They are just tools. "If all you have is a hammer then everything looks like a nail." applies here. Another would be "There are no bad computer languages just dumb programmers who don't know how or when to use them."

From: apratt@atari.UUCP
Message-ID: <1746@atari.UUCP>
Source record: 247805

krieg@jupiter.uucp (Andrew Krieg) writes:

>I have a few questions about disks and disk formatting for the ST.
> 1) [What is Twister format?]
> 2) [Why 82 tracks?]
> 3) [Are there any 1.4M drives out there?]

"Twisted" disks have sectors on successive tracks offset from one another. Instead of always starting sector 1 at the index mark, they start sector 1 there on track 0, sector 3 on track 1, sector 5 on track 2, and so on. This makes disk I/O faster, because there are only two sectors of latency between reading sector 9 from track 0 and sector 1 of track 1, instead of 9 sectors of latency waiting for the whole disk to spin around.

You get "Twisted" disks any time you format a disk from the Desktop using Mega TOS or any newer TOS. Once the disk is formatted it will be fast no matter where you use it.

Atari disk drives are only guaranteed to handle 80 tracks. Some people have discovered that some drives can actually access 82 tracks, so they have written formatters which will format 82 tracks. This is not recommended, and you can actually damage your disk drive by telling it to seek so far that it bangs into something. The Desktop format operation will only format 80 tracks.

I am not aware of any 1.4M drives available for the ST. I know you couldn't just plug one in: they get 1.4M by doubling the data rate, and the controller inside the ST couldn't handle it.

A diagram and list of pins can be found in the manual that came with your ST (the dealer should have a manual from his demo system). I believe it is even listed in the table of contents.

If you don't have acces to a ST manual I can look it up and post it for you.

2038. 1040ST memory upgrade

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 17:55:25 UTC
From: chang@cme.nbs.gov
Message-ID: <1810@puertorico.cme.nbs.gov>
Source record: 247810

I'm sure this has been discussed here before, but since I'm a new atari owner/comp.sys.atari.st reader I was wondering how difficult this might be and how much is possible.

I've read in previous articles that 520st's can be upgraded by "simply by adding an additional 2 megs of 1 megabye RAM chips"

I bought the ST second hand but I don't think it's older than two years at most (if there are differences in 1040st versions like there are for the 520's). Is there a way to tell the differences?

Thank you

Forrest

>compared to programs available on other machines?

(I think Flash is a comm program--if it's not, ignore this :-) I've been
using UniTerm now for a while, and have decided it's easily one of the best
terminal programs available for any machine. Even my PC-type friends have
said it's pretty cool, which is pretty good for them, 'cuz they all hate
Atari.

>..... Or the TT (after reading the specs of this machine, I could not
>believe I waited four years for something that "advanced").

Umm, you're telling me a 386 system is advanced? I'm sorry, but it's
really quite a banal little system. There's nothing fancy about a cache.
There's certainly nothing too 'neato' about putting all the processor-intensive
tasks (graphics, sound) on the main processor. It's a lot more fun (and fast)
to use a (gasp) _co-processor_!!!

>The bottom line is, the best deal available on the computing world are the
>myriads of 386 boxes available NOW. You can buy Unix for it now and get
>some good PD development tools. And if you're desperate, you can even
>run MS-DOS. If Intel CPU's are not your bag, the Mac IIcx and IIci are
>really nice boxes with tons of software available.

Intel CPU's are not my bag. Unfortunately, neither is paying Apple up
the wazoo for a slow machine. Oh yeah, I _could_ get a IIci, but if I had
that much money to waste, I'd probably get a NeXT.

Additionally, I just saw an add for a 25Mhz, 60-Meg disk, 4 Meg RAM
486 box that looks like it would beat a 33MHz 386 for $4995. I'd rather
have that, if I was going to go the route of a boring machine.

Can we stop this incessant "Your computer sucks, 'cuz mine's better'
stuff now? Very little is accomplished except for reiterating the point
that no machine has everything everyone wants.

2040. Re: Why Atari?

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 18:23:49 UTC
From: horsch@grads.cs.ubc.ca
Message-ID: <5380@ubc-cs.UUCP>
Source record: 247812

With all the talk around here about how people feel about their
decision to buy/support or not to buy/support the Atari line
of computers, I thought I'd put in my CDN$0.02.

Way back when I was one of the first to buy a 520ST, I bought it
because of the price. It wasn't cheap for me, but it was cheaper
than comparably able MACs or Amigas or PCs. I knew I was bringing it
into a household which, aside from me (and I was still learning),
had no computer experience at all. GEM's intuitive user interface
was important!

I suspect that quite a few people bought STs for these reasons.

But I remember an article in STart #2 (I think) by Tim Oren. He
waxed speculative about the potential of the ST line: there were
many interesting things one could do with a machine which had a
lot of memory standard (recall that in '85, having 512k standard
was a big deal for most personal computers), graphics abilities,
a reasonably fast microprocessor which was not going to hamstring
future processors in the 68k line with compatibility problems, etc...

I believe Oren was right. The ST had a lot of potential.
Somehow, we, the ST users community forgot about that
potential (no blame, just observation). If I may venture
a guess, I think we expected too much from Atari in terms
of improved hardware (re: ROM TOS, blitter, 1040, SLM,
MegaST, ATW, STacy, TT, TOS 1.4 ((I know TOS is software,
but when it comes in chips from a factory, and one can only get
it through Atari, it looks the same as hardware))).
The sentiment seemed to be: "If only I got the X, then
I could do amazing things with this machine!" (X being
a member of the previous list). Of course, as X became
known as Vapourware, so did the 'amazing things.'

It is clear that the ST line lost its edge in potential. I am
not sure that the TT will provide any more potential for
those willing enough to try it (again: not opinion, just lack
of data).

Right now, I know someone who needs to upgrade his computer
system from an old (hardly) portable 64k CP/M Kaypro (I think).
Based on my experience with my Atari, he seems ready to get
a 1040 for himself. He will undoubtably get a good price,
but I wonder what else he will be inheriting...or not inheriting.
I am not sure, but maybe I'll tell him to look around
a bit more at the competition.

Mike (All this for CDN$0.02. Opinion without the Price!)

```
|
|Is there a printer spooler that operates like the unix printer spooler:
|it prints all the files in a directory, sequentially by date/time. With
|a hard disk, this could be a better spooler than one that eats up a chunk
|of RAM and doesn't support queueing and de-queueing (via file deletes).
|
```

The Neodesk 2.0x printer queue works sort of like you want. It keeps a list of files to print and works down the list in the order in which the file was put in the queue. Later versions (2.04 on, I think) incorporate a small 8K buffer. I rather like this queue, since individual files can be removed or the order re-arranged without flushing the whole thing.

Message-ID: <8910260705.AA01039@ucbvax.Berkeley.EDU>
Source record: 247815

If you want to know what is better for MIDI just ask recording studios what they have. It is mostly Atari STs.

Plus the sequencers available. There is a very high performance professional one available in the Hybrid Arts. There is also the C-Lab which has a very good reputation too. And if you got the bucks and want to do your own digital mastering, you have ADAP, which can also be used as a sampler, abeit it is not so portable like the rack mounted jobs that are available commercially.

```
|Codes that call other codes (e.g Signum calling its printer routines,
|EasyDraw calling OUTPRINT.PRG) needed shel_fix to work properly. Yes,
|I use shel_fix and it works - except on CRICIT. CRICIT editor will not
|call CRICIT register and vice versa if these codes were launched from
|NeoDesk. They work properly when launched from the standard desktop.
|
|Anyone know why (Dan Wilga, are you out there?)?
|----------
```

Dan Wilga is not on Usenet (or wasn't a few months ago). He can be reached via e-mail but I can't find his address at the moment - it's in your Neodesk docs someplace, though.

I don't know about CRICIT launched from Neodesk, but I have been around the block a few times with shel_fix and Neodesk. I've found that certain auto programs interfere with shel_fix at times. These programs are G+Plus and Universal Item Selector II. (I'm sure there are others). Note, I said at times. I've seen shel_fix work with some progs and not with others, all in the same set-up.

If you use these progs, I find that the following execution order works with all my applications:

G+Plus
shell_fix
UISII

Hope this helps!

A friend of mine here at California State University, Chico got his GCR a couple of weeks ago. He loves it. I think, however, that he pre-ordered it a long time ago. He owns the original Spectre also. I heard a a couple of months ago that Gadgets was backordered a couple of batches. Unless you ordered it a long time ago, it may be sometime until the dealers get them. I hope this answers your question at least a little.

2046. Re: Deskjet SOFT fonts

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 19:39:18 UTC
From: neff@hpvcfs1.HP.COM
Message-ID: <2150018@hpvcfs1.HP.COM>
Source record: 247818

The DeskJet soft font format was intentionally undocumented for reasons I will not go into. The soft fonts HP supplies can just be sent to the printer as a binary copy, as long as you preceed the binary copy with the set font id escape sequence (Esc*c#D where # will typically be 1 for the first font you download, 2 for the second, etc.). If all you want to do is download HP supplied fonts and you are able to read from an MS-DOS disc, this information should be sufficient to make your own downloader.

If you want to actually create and edit fonts, that is a different matter. We do send out soft font format documentation upon request. Initially try our official support line at (208)-323-2551. If they can't get you the information through official channels, send me some email. I'll give you the name and phone number of our person here who supports ISV (independant software vendors) and will give out this documentation. I will not post his name and number on the net, however (I might get killed or worse). Our previous approach was to only give out this information on a "need to know" basis, but I believe we are more liberal with this information now.

2047. TURBODOS and AHDI v3.01 can't get on!

Newsgroup: comp.sys.atari.st
Date: 1989-10-25 20:55:00 UTC
From: DAGLEISH@FRILL.BITNET
Message-ID: <8910280708.AA12501@ucbvax.Berkeley.EDU>
Source record: 247819

Hi,
2 points:

1) The ATARI hard-disc driver AHDI version 3.01 and TURBODOS (distributed with the hard-disc utilities disc for MEGAFILE 30's by ATARI, France) are totally incompatible. If you use the new AHDI and TURBODOS, then when you try to copy files to the hard-disc then nothing happens. All the usual disc-activity light flashing takes place and the file count in the alert box decrements as normal, but at the end of the day none of the copied files appears on the destination disc. If TURBODOS is not activated then the transfer takes place normally.

This problem occurs even though no other auto-boot or accessories are used.

I am thus obliged to make do with v1.7 of the SHDRIVER.SYS and so cannot take advantage of the extended partitioning scheme of v3.01. It is impossible to work without TURBODOS as the basic TOS 1.2 is so S*L*O*W when using a hard-disc.

2) My dealer (in LYON) has not heard any news of the arrival of TOS 1.4 (he says he thinks that ATARI is going to go directly to TOS 1.6 as used in the STE (which I briefly played with in the shop - RICHARD COVERT PLEASE NOTE, THIS IS NOT VAPORWARE). ==========

SO, is there anyone in France listening who has got a copy of TOS 1.4 in ROM (for AZERTY keyboards)? If so where did you get it, and how much did it cost? I would love to chuck out TURBODOS, STSELECT, FOLDER100 etc. and use AHDI V3.01.

You might want to check out Absoft Fortran. It compiles a lot faster than
Prospero, although the resulting code is not as good. My times are
- 20 sec to compile a 20-30K file
- 20 sec to link with 25 others to a 500K program (using my own linker)
- 20 sec to find out what went wrong this time 'round
That is a LOT faster than on our mainframe.

>What I find annoying is that ROMs that fix bugs in the operating system
>that was promised years ago is costing me $100. Surely Atari could
>afford to foster some loyalty by offering a "nominal" trade in price
>for ROMs.

C'mon folks, give Atari a break. They're trying to provide support for their product and all they get are complaints. Trade-in's on ROMs don't make sense, they don't have any intrinsic value so what's the point of trading them in? It's not like a used car where the manufacturer could resell it. Mask programmed ROMs cannot be reused, so they have no value. Why should Atari take them on trade in?

Most manufacturers of industrial computers charge some sort of annual software maintainence fee, for this fee you may or may not get your bugs fixed, depending on how severe they are. Atari is simply doing the same thing, only they are doing it on a "pay as you go" basis. I realize that Atari is selling into the consumer market and customer expectations are different, but I don't think their upgrade policies are any different than the other home computer vendors.

> The mac os is essentially free (you can buy an official disk
>for $45) and I wonder how the copywrite would affect TOS.

$45 doesn't seem much like free to me. I think you are really alluding to the fact that Mac os releases are sold on disks and are thus easier to illegaly pirate. (I don't know what Apple's view of copying is, but I suspect they don't approve.) You must also keep in mind the cost of the distribution media, Apple ships their OS upgrades on 3.5 in. floppies which cost significantly less than the six ROMs that Atari is using. Also, the ROM set is going for $90 in my area, so it sounds like your dealer is overcharging, unless that $100 includes installation, in which case it's a good deal.

> Are updates
>to TOS separately copywrited? If I own a copy of TOS 1.0, am I legally
>entitled to make an updated copy to 1.4?

I'm not a copyright expert, but I don't believe copyright law entitles me to an update. When is the last time you heard of anyone getting a new copy of a book when the revised edition comes out? TOS 1.4 is not the same as TOS 1.0, you are not making a copy of TOS 1.0 when you copy a TOS 1.4 ROM, thus the "backup copy" clause of copyright law does not apply. Making a copy of a TOS 1.4 ROM that you do not own for your personal use is a violation of copyright law.

DISCLAIMERS:

These opinions are my own and have nothing to do with Tektronix.

I do not represent Atari, I am only an St owner. I also own an IBM PC. I sometimes use an Apple Macintosh at work. I don't LOVE any of those machines, they all suck, one way or another.

>is supposed to be stdaux). So you need a sheel that sets up 2 to default to
>the console. On the other hand it is Unix compatible.

>If you use -1: it is TOS standard, compatible with the desktop, but you
>can't redirect it to a file.

Boy, if only all the questions on the net were this well thought out
and concise. Way to go, Piet!

My personal opinion, not to be construed as an Atari policy statement,
is that handle 2 is a fine choice. I realize it requires a shell which
supports it, but I think it's worth the effort. You can even tell if
you've been run from the Desktop, and if you are, you Fforce handle 2
to -1 or something.

(You can tell if you're launched from the Desktop by checking for a CR
character just PAST the end of your command line. It's not very nice,
but it works. Here's the code you'd have to use in your startup,
before anybody munges the command line.)

```
----------------------------------------

move.l <basepage>,a0
lea.l $80(a0),a0
move.b (a0)+,d0
ext.w d0
cmp.b #$d,(d0,a0)
bne notdesktop

... launched from desktop ...

bra done

notdesktop:

... not launched from desktop ...

done:

----------------------------------------
```

Of course, if your shell puts a CR there in a misguided attempt at
being compatible with the desktop, you'll be in trouble. Another way to

tell is to see if there's anything but PATH in your environment: most
shells put SOMETHING there...

The American 'magazine' Computer Shopper (November 9, 1989), arrived
at the racks of our university with either the most unbalanced intro
sub headlines or maybe the most truthful. I've been trying to avoid
the usual "What's wrong, what's right" discussion about Atari, but this
magazine worked me up.
Here are some quotes:

FRONT COVER:

O PORTFOLIO
Can an MS-DOS Handheld Save Atari Corporation?
~~~~

PAGE FOUR:

O (color picture of the Portfolio)
O "It's true--while not everything in the computer world is from Kansas,
it is all getting smaller. Witness Portfolio, Atari's MS-DOS
Munchkin. The company is clearly out to grab some of the market share
of Sharp's Wizard, but this yellow brick road may or may not lead Atari
to riches in the Emerald City. Is this MS-DOS "compatible" handheld
worth the bucks, or should we toss it to the flying monkeys?"
~~~~~~

Is this responsible journalism, especially for the lead-in intros???
I should think not. GRRRR!
The article in the journal is remarkably balanced and gives a fairly
nice review, indeed, it is quite balanced. Although I'm amazed at the
sudden rush to buy the Portfolio, especially when the Toshiba 1000 is
being offered for a price not much more--and one gets a full sized
keyboard and 3 1/2" floppy drive, Computer Shopper is taking a very
unfair slap at the machine in the headlines and treating it nicely in
the text body. Give the Portfolio a chance to try the market, for
crying out loud...
On the other hand, maybe Computer Shopper is revealing a deeper
problem. Perhaps the sub headlines demonstrate how Atari U.S.A. is
really seen by others in the U.S. Maybe the distressed developers
and puzzled users of Atari U.S.A. have a voice in this slip of the
journalistic tongue. ---just my opinion, folks. It is amazing what
can pull my string. I love my ST but am tired of being defensive of
it when in the computer crowd, i.e., "I've never head of an ST... I
thought Atari was bankrupt... ST's? You mean XT, as in the PC, right?"
Ok, flame off. It is just that the Computer Shopper sort of
raised my blood pressure and this net was my outlet.
Also, when I say "ATARI", I'm not directing anything towards
any of the kind and probably overworked Atari technicians and

engineers who take the heat on this net.... 'nuff said!

... and so on ...

I am concerned about the fact that programs work for some people under TOS 1.4 and not for others. Either (A) the program is different or (B) the TOS is different.

People, the only official TOS 1.4 release is dated 4/16/89. You can see the date in the ROM by dumping offset $18 from the start of the ROM (which is $FC0000 on ST, but not STe!) ... you should see the date as four hex bytes: 04 16 19 89. If you don't see this, you don't have the right version.

You should GET the right version: the old ones are inferior, and the incompatibilities which caused some of these programs to fail might have been fixed in the released version - that would explain a lot of this confusion.

>out. If the public doesn't support, bye bye Atari, bye bye new ideas,
>bye bye change....

BZZZZ! Wrong. The people that have Atari's _DO_ support them, this is the _only_ reason they are here. That _DOES NOT_ insure Atari's continued semi-success in the States. Third party support, _AD CAMPAIGN'S_ would _really_ help a _lot_, maybe even some product announcements from Atari that were true (btw, good job on the PC hand-held and the Lynx (if we see it), even though I don't want one, ya' done good) like the TT, or the Transputer workstation. Someone complained about the TT being less-than-advanced, but really, little is these days. I think it's a step in the right direction if it ever gets out and into _our_ hands.

Oh well, enough underlines for a day.

Source record: 247831

I love my ST because it will run Calamus, which saves several hours every week for my spouse and me over other DTP packages. I wish that it had a lot of things that it does not, and as a hacker, I'd switch to a Sun in a second if I could afford it. I also find 4 megs too crowded.

Microsoft produces MSDOS, not IBM. Same with Windows. DRI produces their GEM, and companies other than IBM produce the best IBM-compatible computers. Who cares if Atari does not new software stuff (like the Postscript clone) for the ST, as long as someone does?

And if other people stop supporting the ST, I stop using it.

From: winston@fjcnet.GOV
Message-ID: <212@fjcp60.GOV>
Source record: 247834

I don't think I said that the ST sucked. The gist of my previous post was that even if Atari manages to get the TT out in time, it will take a while (if ever) before a significant software base is developed for it. Yes, Uniterm is a nice program (thank's Simon). But let's get real. I want to use some development tools that just are not available on the ST. Smalltalk-80 is available for the ST, but there does not seem to be any way to get the thing here in the U.S. (yes, I called Parc Place Systems).

The thing is, 386 machines are pretty decent machines (okay, so you don't like Intel chips) that are readily available at decent prices. You can get some nice expansion cards for it too. And there are literally tons of software available for the machine (running on at least three operating systems).

Yeah, I think we all have done enough bashing on the STE/TT lately, especially since I have yet to see one of the things in a store.

I think the $4995 486 system dmewton was talking about is the Cheetah Gold 33. There is a short article on the computer in the November 1989 issue of Byte. Seems like a pretty good deal for the price (4 megs of ram, vga graphics, 60 meg hd).

Source record: 247836

This is in response to a request for information on the Atari Transputer Workstation (ATW). There is an article in the November STart.

Here are some of the highlights :

RISC (reduced instruction set computer) running at 50 mHz
32 bit bus
4 megabytes of RAM, upgradable to 120 meg
With all 4 boards, that is 13 transputers, the machine
runs at 10 MIP (= 1/5 Cray)
Helios OS (UNIX-like) with both CLI and Graphic interface
Each window has it's own dynamic color map and palatte
Analog RGB monitor : 1280x1024 w/16 colors
1024x768 w/256 colors
512x512 w/16 million

Base system, with one transputer is $8000
the RGB monitor is 2000 pounds ($3000 ???)
Each duaghter board is $3000
(A maxed out system will run you about -gak!- $80,000)

If Atari is serious about this computer, then Jobs could get
some unexpected competition. That is the operative word - IF.

I just bought the latest issue of Analogue last night....it's the first one in the new merged (analogue,stlog) format. In the editorial page, the tone was very upbeat and no mention was made of the magazine ending. As a matter of fact the editorial said that existing subscriptions for each of the old magazines will be transferred to the new merged magazine and that if you previously held subscriptions to both magazines, the subscriptions would be added together and applied to the merged mag. Doesn't sound to me like they are going under.

I have the TOS 1.4 chips and the 1 page document on how to install them. I also have a 1040STfm. I think the ST has the TOS 1.0 in it, but it may have 1.2. Can anyone help me with installation? My big question is, do I really have to solder anything? The installation document says three solders have to be made.

Yes, I would rather have a dealer do it, but there aren't any around here.

Is it possible to tell what device a (gemdos) file handle is really pointed at? In particular, is it possible to tell if it's really pointed at the screen? In doing some IO hacking, I've come up with some stuff that really does want to be able to use Bcon<foo> when it can figure out that the thing being talked to is the keyboard/screen, but there appears to be no way to tell, other than blindly assuming.

I'd like to find something modular and supported (Hah!), but will settle for anything. Hints anyone?

> Enquiring minds want to know....

Nope, it does NOT multitask. This has been mentioned by John Townsend et al on GEnie in the past. The TT will simply be a faster ST with slightly better graphics. And John Townsend said that the first TT will be called TT/P for the Plastic TT (it is in a plastic box). Later, if any, models are supposed to be in a Tower cabinet. Also, someone posted a message on GEnie about the upcoming Comdex show in Las Vegas in Novemebr. This person got a brochure from Comdex and Atari was listed as shwoing the "TT/Megastation". So, maybe the new TT will be called the TT/Megastation. Who knows? Anything is better then TT/P. It will use TOS 1.6 which is the same TOS being used in that other VaporWare the 1040STE. So no mutlitasking, unless you call DAs multitasking of course.

> (er, well I guess I still like my 15 year-old cub scout uniform too
> <grin>).
>

I don't think that ANYONE could have supported Atari more then myself over the past five years. I own a 520ST (3 years old and still running), a Mega ST2 (20 months old), an 85 meg drive for the 520ST, a 130 meg drive for the Mega, an Atari SLM804 laser printer, 3 Atari monitors (2 color, one monochrome). And lots of commerical software. I have bought most of the available word processors, I own LDW Power and VIP Professional. I wqon Mark Williams C and FLASH and Interlink. The list could continue for pages.

And when I first bought the 520ST, the ST was a steal. And when I first bought the Mega I was told about all of the future boards being designed for it. Over the last 3 years the ST, both 520/1040 and Mega ST, have been left in the dust by IBM PC clones. And now that Commodore is producing an Amiga (A3000) which uses non-interlaced graphics, the A3000 is a serious contender in my book.

But, what has Atari done to improve the ST. The Diablo Emulator for the SLM804 lp is so bad that Word Perfect has dropped the Atari LP as a supported WP printer. So, much for Atari support. Atari has never released an Epson Emulator for the SLM804. So much for Atari support. I know, folks say that I should NOT have bought the SLM804. But, what it does it does very well. I love the quality of my C listings and the speed at which the SLM804 prints. But its shortcomings are frustrating, and Atari's lack of support is maddeining!

I would dearly like to get a good CASE tool but if you think I will ever see one for the ST or the TT you are pretty optimistic. The software market has just plain and simply left the ST. Except for games. There are plenty of new games for the ST. Just lots and lots of games. And mostly from Europe.

So, that leaves the ST as a Game Machine. and maybe that where ATari should concentrate. Sell the ST and TT as Super Game Machines and blow away Ninetendo.

So, why do I like my ST? first, GEM is fairly easy to program in. Second, Mark Williams C is a great compiler. Third, I dislike Mac's hardware even more then Atari's lack of support. The ST's DMA port blows away the MAC IIci when it comes to data xfer from hard drive. So, I don't like Mac hw, but do like Mac sw, and Apple support. I like Atari ST hw, and sw but hate Atari's LACK of support. So, unless I design and build my own computer I am stuck in an imperfect world. And as I have over 6 grand tied up in Atari computer gear, I will stay with Atari for awhile.

But, I will NEVER buy another computer from Atari. Especially a closed system like the TT/P. One lousy short VME card slot does not make an OPEN system. you need 5 or more. One slot just guarantees that no one will design for it. Lack of resources.

> Chris
>

********** GOOD NEWS SECTION **********
THE FAST TECHNOLOGY TURBO16 is one of the best things to come to the ST market. It works in all models of the ST and gives you an increase of upto 50%. I have 2 friend who have it and they both love it. T16 is a small pc board with a 16 MHz 68000 and a 32 Kbyte Fast static RAM cache. It is the cache ram that gives the most increase in performance for your ST. So, please, if you have a local Atari dealer, check out the Turbo16 from Fast Technology. It is wonderful.

winston@fjcnet.GOV (Winston M. Llamas) writes ...

>I don't think I said that the ST sucked. The gist of my previous post was
>that even if Atari manages to get the TT out in time, it will take a while
>(if ever) before a significant software base is developed for it.

If the TT runs all properly written ST software (much faster!), what's the
big deal? And the optional Unix OS is said to be System V and capable of
running anything written for the Motorola binary standard. I don't think
it's reasonable to term either of those software bases "insignificant."

I sympathize with your frustrations at not being able to get Smalltalk or
Scheme or whatever, but let's be serious: those are not significant
applications in terms of the general market. They're weird.

Anyone who's looking for mainstream applications -- word processors,
1-2-3-compatible spreadsheets, desktop publishing, databases, etc., will
be in great shape. There's a lot of specialty software out there, too
(MIDI is the obvious example).

I bought an ST in 1985, so I know what a software drought is like. The TT
won't have that problem.

2076. ST vs Mac prices revisited

Newsgroup: comp.sys.atari.st
Date: 1989-10-26 15:59:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8910270721.AA26358@ucbvax.Berkeley.EDU>
Source record: 247848

The comparison I gave of Mega and Mac SE prices were both corporate and both Canadian prices. Someone replied to me that one option would be to buy a third party RAM upgrade for a 1040ST. In the business environment, keyboard systems are looked down on (I do not make the rules, just live by them) and the Mega 'looks' like a business machine.

The single biggest problem with Atari systems (hey, do not flame me, I sell Atari systems) is the high cost of hard disks. When a 1040ST with a Megafile 30 costs $1800 and a TURBO XT clone with 30 meg drive costs $999, it's tough to convince the neophyte buyer that the extra bucks are worth it. Hey, most people I deal with as potential buyers have NO background in computing and it's just impossible to explain the advantages to someone who is intimidated by computers.

I think the 1040ST + 30 meg drive should be in the $1200 - $1300 range
Mega 2 + 60 $1800 - $2000 range

if I am going to compete (especially with a slogan Power Without the Price)

Uh, just a small. I believe the list-price on the SLM804 is $1995, though
I don't doubt the "street price" could approach your figure.

he he

Anyway, I paid $995 for my SLM804 when it was introduced in early 1988.
My dealer got a large order of them in and couldn't sell them at the
list price of $1995, so he had a close out at $995. MOst other dealers
were selling SLM804s for about $1495 in 1988.

I don't know what the "street price" of a SLM804 is now, but my dealer
is selling them (or trying to anyway) bundled with the base package
of UltraScript for $1495. He will deal down to around $1300 I am told.

and I have seen ads in newspapers here in Phoenix for the HP LJ IIP
for $995. unbelievable!

2078. WordPerfect for the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1989-10-26 16:06:32 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891026.10063055.015726@SFA.CP6>
Source record: 247850

A post on this net suggested that WordPerfect for the Atari ST had dropped support and that the ATari Laser was also not being supported.
Both statements are not at all correct.
WordPerfect released during August 89, the latest and FASTEST of their ST upgrades. The new release supports, on an optional basis, either an IBMish file selector for all file calls and maintenance, or the ST version, meaning that the user can use any of the excellant and superior file selectors available in the PD/SHAREWARE and commercial outlets.
The new WordPerfect ST has corrected bugs that would show during multiple print jobs and the print preview function, such as it is, does work well. New printer drivers have been added, especially for the Hewlett Packard system, including the DeskJet series and there are various Diablo configurations for emulating into the Atari laser.
Other new features include:

1. Running word count during spell checks.
2. Available disk space can be seen in the LIST FILEs area.
3. Searching has been expanded to include all three types of hypens.
4. Ultrascript is supported.
5. Improved PostScript printer support for extended characters has been added.

Well, what happens when Calamus gets ported to another, better supported machine? Will you still like your ST?

>Microsoft produces MSDOS, not IBM. Same with Windows. DRI produces
>their GEM, and companies other than IBM produce the best IBM-compatible
>computers. Who cares if Atari does not new software stuff (like the
>Postscript clone) for the ST, as long as someone does?
You should care a great deal. Argument follows thusly; Who cares about the 40 folder limit problems. Someone has hacked a workable solution (not atari). Who cares about the bugs in TOS? I have these programs here that have workarounds built into them. So what if the workarounds break other, more fundamental rules? So what if it makes fixing the bugs difficult, if not impossible, without breaking with popular software?

Atari has to lay down the rules. I don't keep track that closely of ST happenings, but I'm truly surprised that they don't have a postscript emulator themselves for their laserprinter. Wasn't it announced with the release of the printer. Letting 3rd party people do your work on "important products" is fine, as long as they are working very closely with Atari. This isn't happening. At some point, things will become increasingly incompatable, and software companies will eventually give up on compatability with other packages entirely. You must have a strong standard bearer, and Atari isn't it.
>And if other people stop supporting the ST, I stop using it.
Interesting.
> David Megginson, Centre for Medieval Studies, Toronto

I have resisted posting a comment on the latest barrage of Atari bashing, since I don't own anything made by Atari (just sold my 7800 ;-)).

I am amazed at some of the comments I'm reading in this newsgroup. The gentleman who posted his 386 comparison pointed out something, possibly inadvertantly, that will have a lasting effect on TT sales.

If you are a new company, or a company that is trying to get a toehold in the market, you can't simply sell something that is "as good" as the existing standard, at around the same price. Your product has to the compellingly better in some respect. Check out the Macintosh; it's not all marketing. And look at what Commodore is attempting to do with the Amiga.

On what may appear to be an unrelated note, look at what Atari is doing with their slick piece of handheld technology, the Lynx. Two months till christmas....

In article <9995@cadnetix.COM> terrell@cadnetix.COM () asks:
> How does documentation differ in Europe? Do US software developers go
> to the trouble of converting to British spelling? Do British users
> resent it when they don't? Or perhaps the users don't care?

I have been involved with product translation tools the last six
years. In the companies I've worked for all actual translation
was done by subsidiaries or branch offices in the target country.

In most countries everything has to be translated. England is a special
case because we almost write the same language. It's up to whoever is
in charge of marketing for England to decide how important it is. I know
we translated it in the first company I worked for, but we sold to banks
and other industries that might be more concerned than buyers of home PC
software with how "proper" things are.

> Does the European user community tend to get US products before their
> counterparts in the US?

Not where I've worked.

At one company the tools, text resource files and documentation were
not turned over until the product was completed. European versions of
a 1.0 release were several months to a year behind the US release, but
versions > 1.0 were usually quicker because only the changed text needs
to be translated (anything unchanged can be brought forward from the
previous release).

In another company updates to the textual items and tools were released
periodically as they changed during development, so the European releases
were only a month or two behind the US.

As an important note, from a developers point of view textual translations
are easy. The hard stuff is dealing with different sizes of paper, different
date formats, different currency formats, variable length currency symbols,
decimal notation (many European countries reverse the US period and comma)
and many other *format* changes. Any routines dealing with these things
must be general and switchable, either as compile time options, or better,
as user configurable options.

My personal favorite was a mainframe-based office automation system that
could run in any of up to 19 languages at once. Each user specified which
of the loaded languages he or she wanted to use, and could change it at
any time. Multiple languages sure ate up a lot of disk, though.

As yet another aside, some Canadian government contracts we bid on *required*
a system that was switchable between English and French. If your company
has any aims in this direction, keep this in mind.

-Daniel Veditz

Lets get a few facts straight. Every Apple system software update
cost $0. Thats right -- it's free. Now if you want the docs and
would like to get brandy new disks instead of copies over your
old disks, you can pay $45. I think $100 (list price, you dealer
can charge what he wants, this is America after all) for a set of
ROMS WITH DOCUMENTATION OF NEW FEATURES would be a good deal. But
what does my $100 get me. Roms? No, EPROMS (an rather cheap, slow
ones at that). Documentation. No, just a Xerox of the sheet the
developers got, if my dealer feels like making me a copy. C'mon
Atari, surely you can be just one little bit professional. Can't
you? (Maybe not). After all, the upgrade was promised, but like
the blitter support for the 520 and 1040, I guess all Atari is
good at is hot air.

That's pretty amazing. The following is on page 87 of the manual that comes with an Atari ST computer:

1 - audio out
2 - composite video (sometimes)
3 - general purpose out
4 - mono detect
5 - audio in
6 - green
7 - red
8 - +12 pullup
9 - horiz sync
10 - blue
11 - monochrome
12 - vert sync
13 - gnd

From: UUCJEFF@ECNCDC.BITNET
Message-ID: <8910270721.AA26391@ucbvax.Berkeley.EDU>
Source record: 247759

I think everyone agrees they suck. I bought ST-LOG on newstand of which seemed decent enough so I subscribed, but I have been receiving it for over 1/2 year and I have yet to have one that is decent. I always had STart for a while, but there was nothing to keep me subscribing.

It seems the US magazines assume that all their readers have the IQ of a grapefruit, or do nothing but play games.

This is not just the computer magazines, I sent an article on how to program musical data base systems, how to represent musical knowledge in computer programs so one could write programs in which one could experiment with musical ideas. They rejected it saying it was enough material for a book (read: too long) and that it was not appropriate for their readers.

Come to think of it, most all US magazines write as if they think their readers are boobs. Look at Time and Newsweek.

> softfonts ?? Neither the user manual of the printer, nor the info
> on the 128 KRAM module you need for using softfonts gives enough
> info to write my own downloader, and fonteditor on the atari.

I think that info is in the DeskJet Technical Reference Manual contained in the DeskJet Software Developer's Guide. I wish I knew why it wasn't more accessible. I don't have the information but there's couple of 'questions hotlines' that might be useful. They're even toll-free!

800-367-4772 Handheld/Personal Computer referrals and literature requests.
800-858-8867 Personal Computer technical information and software assistance.

I copied this from the Winter 88/89 HP Computer Users Catalog. Hope it helps.

> HP does supply a software package, but thats's intended to run under
> MS-DOS, and i am not using PC ditto.
I tried it and couldn't get it to work with PC-Ditto. I have to admit I didn't try that hard. I just borrowed an RAM cartridge from work just to see how easy it was. Didn't think it was easy enough, so I gave up. I'm satisfied with my Epson Cartridge for most stuff. I'd like to finish getting the LaTeX stuff hooked up for my higher quality documents of the future.

European countries have a standard which make the week begin with Monday. Years ago the standard was to begin on Sunday. There was a designated week with 2 Sundays when the change took place - which was in the 1970's around a New Year if memory serves me right.

They still don't agree on week numbering, though.

in article <1086@cc.helsinki.fi>, JALKIO@cc.helsinki.fi (Jouni Alkio) says:

> ... I was talking about 386 specific software and there is not very much of it!
> The TT will be ST compatible, just like the 386 is PC-compatible, and MAC II is
> MAC-compatible! I think it won't take very long, when there is as much TT
> specific software as there is 386 specific software.

Thing is, it's not even that necessary to have TT, Mac II, Amiga 2500, etc. specific software. For example, nearly every piece of Amiga software written works just fine on a 68020 or 68030 based Amiga. It takes immediate advantage of running on a true 32 bit system. You can write programs that use 68020/68030 specific instructions, but except for the most CPU/FPU intensive programs, this isn't noticable. Motorola did it right from the start; the linear-addressing programmers mention only one aspect of this.

For the Clone machines, the situation is entirely different. If you're running a standard MS-DOS application, you kick the '386 into 8086 emulation mode. You have no 32 bit instructions and thus get little benefit from a 32 bit bus. Only '386 specific programs take advantage of the machine. The main reason folks buy '386 machines these days is to run their 8/16 bit programs faster -- not because the '386 itself lends much by being a true 32 bit CPU (the '386 SX does nearly as well), but merely because Intel makes 25Mhz and 33MHz '386s, while their fastest '286 is around 12MHz (AMD makes a 16MHz version, which they claim runs 8086 and 80286 software faster than a 16MHz '386).

>> Or something that has support. Dare I say it? Yes, a Mac.
> What do you relly mean by that support?

You generally have to pay for support, and there are various kinds. Some you even get from Atari. For example, an ST dies. At least you have an idea of who made it, and maybe even who'd fix it. I could certainly answer that kind of question for a Mac or an Amiga. Now look at that $2000 loaded '386 Clone. You've probably never heard of that company before, but no big deal, right? After all, it runs MS-DOS, and probably OS/2, so there's no need for you to worry about software support like you would with Apple, Amiga, or Atari. Only, now it breaks down. That company could very likely not exist anymore. Sure, you can buy a name brand Clone from Compaq or someone, but that's going to greatly throw off your price comparison with the aforementioned 680x0 machines, except the Apples or the NeXT.

2092. Self Modifying code

Newsgroup: comp.sys.atari.st
Date: 1989-10-26 19:21:01 UTC
From: covertr@force.UUCP
Message-ID: <46768dca.14a1f@force.UUCP>
Source record: 247764

I have a friend who has written some shareware programs
(ARCIT, ARCIT Shell, UNARCIT etc) and he would like to
make his code self-modifying. IN particular he would like
to save the state of various buttons that he uses.

1) Write the data to an external file (*.CFG), but now
you have to maintain a PRG, a RSC and a CFG file. Clumsy.

2) Write to the RSC file, but my friend wants to incorporate
the RSC into the PRG (using RSCTOC or equivalent). So, there
may not be a RSC to write to.

3) Write to the PRG file. Best of all since you need it to
run his program!!

But how do you modify a PRG file on the run?? One idea is
to store some unique string of characters indicating the
start of a buffer region. Then the PRG could do a binary
search of itself to locate the string in the disk file,
and then overwrite the next XX bytes with the new config
data. But you would have to make certain that the search
string is unique.

Another idea is to reserve XX bytes at the end of the
PRG file. If you read in the PRG as a binary file you
could LSEEK to the end of the PRG and then LSEEK back
XX bytes.

Well, does anyone have any C code that could be used??

I am interested in this whole idea.

Rich Covert

How can one go about do this in C??

I have several ideas.

Under TOS 1.4 (I have not tried the other versions yet) with the TOS14FIX either installed or not installed, if I *manually* edit my DESKTOP.INF file and fill the desktop with icons (I've only tried medium rez) and reboot, the icons are drawn properly on the desktop (all rows full), but (big BUT) no file in the system is recognized as an executable program! All files are displayed as 'text' icons, whether they are executable or not!

If, however, I reduce the number of desktop icons to 28, then everything works as it should.

Should this be considered a bug? OR am I to assume that the magic number of 28 is derived as such: 26 drives (A-Z) plus the cartridge (c) plus the TRASH icon = 28 icons max.

Can this be gotten around? I thought perhaps that the TOS14FIX.PRG was going to take care of this...

I have a specific purpose for doing this.

Enlightenment (and an answer to whether this is so on TOS 1.0 and 1.2) would be most appreciated.

A puzzled,
Michael B. Vederman

2094. Music software for internal sound chip and MIDI, for sale

Newsgroup: comp.sys.atari.st
Date: 1989-10-26 19:25:38 UTC
From: wallace@oldtmr.dec.com
Message-ID: <1330@engage.enet.dec.com>
Source record: 247766

KEYS! With Auto Composer.

Dr. T's Music Software

For the beginner and the professional.

FOR THE BEGINNER:
o Does not require MIDI, playback your music through the Atari internal sound chip.
o Totally Mouse-Driven user interface.
o Painlessly copy your favorite sheet music and hear what it realy sounds like.
o Mask the on-screen keyboard with 144 of the most used chord symbols.
o The notes you record are instantly displayed on screen in traditional musical notation.
o Supports chords up to 8 notes "deep".
o The on-screen keyboard lights up as your music plays.
o KEYS! comes eith many preprogrammed music pieces.
o Auto Composer creates themes and harmonies either from scratch, of from your music!

FOR THE PROFESSIONAL:
o Full MIDI support.
o Note name, MIDI channel, note duration, polyphony, and velocity are quickly recorded using the mouse or a MIDI keyboard.
o Completely compatible with Dr. T's Keyboard Controlled Sequencer (KCS), MIDI Recording Studio (MRS), and Copyist programs.
o Three modes of operation including Record, Audition, and Auto Composer.
o Editing includes single event edit, move event range, copy range, and repeat with transpose.
o Immediate musical notation displayed on the on-screen grand staff.
o Functions on color or monochrome 520, 1040, or Mega ST computers.

List price is $79. Asking price $40.

Unfortunately, this is a product that has zero relationship to the ST world (and so now someone will followup to educate me as to the nature of Economics and profits and probable wonderful spillover effects into ST products, ya, ha ha, right), and I'm beginning to question the relevance of Portfolio postings to comp.sys.atari.st, Atari-related though they may be. I gently suggest that perhaps such postings should be directed to comp.sys.ibm.pc or comp.sys.msdos.thingies or comp.sys.portapotty_boxes or whatever.

Interesting that we U.S. ST owners have so little of substance coming from Atari to discuss that we could wax enthusiastic about an MS-DOS flavor of Intel-driven box that just happens to carry the Atari logo. Ugh.

2097. Atari ST questions - before I buy one

Newsgroup: comp.sys.atari.st
Date: 1989-10-26 19:53:50 UTC
From: mfs@edison.cho.ge.com
Message-ID: <8910261953.AA29075@edison.CHO.GE.COM>
Source record: 247769

I need an Atari ST.

I will be using it mostly for MIDI; I want to put patches from my collection of synthesizers into ST format. Basically, I want to write a simple Sysex load program that will allow me to distribute patches on disk to anybody that has an ST (and the appropriate synth of course). So I have a few questions for all you ST/MIDI experts:

o What is the minimum (ie least expensive) ST configuration that will allow me to be (disk-wise) compatible with the most ST systems ? Can you quote some typical prices (mail order or retail) ?

o Will I also need a single-sided floppy drive to be fully compatible with everybody else ?

o Can I use a standard composite input monochrome monitor with the ST ?

o Can I do a sysex load/dump in BASIC (which I assume comes with the machine), or will I have to buy a C compiler ?

o Anybody got a used one they want to get rid of ?

Thanks,

MarTan

'r' probably won't work. Try mailing to one of these:

I can't imagine that the cyrillic stuff was a problem. I *NEVER* saw any computer in the USSR producing *ANY* cyrillic signs neither on the screen nor on the printer ...

>(...)
> I understand that a Danish/British computer called
>Thor, which does work well with cyrillic, has taken a lot of the USSR
>market.
There is one great problem in the USSR:
They don't have something what is similar to our market in the capitalistic western world. If somebody needs a computer, he can't buy it. Only if the plan allows someone to buy something, he is able to do so.
But he can't buy the machine what is cheap *NOW*, he has to buy the machine what was cheap upto 5 years ago.
But what was a good deal 5 years ago ???
But that's just one aspect ...
Another one is that Russia don't have the money to buy computers like the ST. They need higher-performance machines (but, unfortunately, they aren't able to get these, they could only get the ones they don't want, say ATARI ST ...)

Funny, but true !

Richard Covert writes:

>I have a friend who has written some shareware programs
>(ARCIT, ARCIT Shell, UNARCIT etc) and he would like to
>make his code self-modifying. IN particular he would like
>to save the state of various buttons that he uses.

Just a minor point:

This isn't technically what "self-modifying code" means. The term
usually refers to executable code that changes/creates executable code
at run-time. An example might be a bit of code that writes a certain
number of move instructions into a buffer, then jumps into the buffer.

While self-modifying code can occasionally be useful (perhaps for loop
unrolling), it has two major problems:

1) It's incredibly difficult to understand, modify, debug, and maintain.
2) It won't work on machines with instruction caches.

Way back when, self-modifying code was thought to be a really powerful
technique. I seem to recall there was quite a debate about its merits,
out of which came the "Harvard architecture", where code and data are
kept in separate places (and never the twain shall meet).

Anyway, I think these days that most computer scientists would agree
that it is simply "tricky" and confusing, and should be avoided.

[Richard's stated options:]

>1) Write the data to an external file (*.CFG), but now
>you have to maintain a PRG, a RSC and a CFG file. Clumsy.

I don't see why this is clumsy. It makes the program much easier to
maintain. It would be even nicer if the config file were human-readable
and editable. C provides fprintf and fscanf for this sort of thing.
If you use these, every C programmer will know what you're doing right
away.

>2) Write to the RSC file, but my friend wants to incorporate
>the RSC into the PRG (using RSCTOC or equivalent). So, there
>may not be a RSC to write to.
>
>3) Write to the PRG file. Best of all since you need it to
>run his program!!

No offense, but I really think this is a "sleazy hack". What's the point of
doing this? Then you have to worry about what happens when you

(heaven forbid) modify the source code and recompile, thereby changing
the size of the executable. And, as you pointed out, you have to come
up with some "clever" scheme to make sure you don't clobber something
useful (like executable code) in your binary. Whatever you come up
with will likely be non-portable as well.

If you don't want people to see the config information, why not put it
in a hidden file?

>[1st suggestion --- store a unique string in the binary and search for it]

Not only is this risky, but it's also going to be slow. Additionally,
putting things like

```
static char config[1024] = "MAGIC STRING HERE";
```

in your source seems like one of the easiest ways to bewilder anybody
looking at the code (including you).

>[2nd suggestion --- reserve space at the end of the binary and lseek]

This isn't risky, but it's still slow. Here you're going to have to
plow through the whole binary to get to your config data. Is this
an improvement over simply opening a separate file?

>I am interested in this whole idea.

It's a nifty concept, but I think in practice you'll find that it isn't
worth the trouble it will cause you.

Far from clumsy, this solution is so elegant and simple it is a wonder
you would even consider anything else.

Some advice:

1. Keep the CFG info in a human-readable (ASCII) format.
2. If the CFG file doesn't exist, create it.

This is a flame. If you think it's directed solely at Hal Meeks, guess again.

In article <4318@ncsuvx.ncsu.edu>, hgm@ccvr1.uucp (Hal G. Meeks) writes ...

>Atari has to lay down the rules. I don't keep track that closely of ST
>happenings,

If you don't know what you're talking about, why do you feel compelled to burn net bandwidth?

>but I'm truly surprised that they don't have a postscript
>emulator themselves for their laserprinter. Wasn't it announced with the
>release of the printer.

The PostScript interpreter has been in the stores for a long time. See previous comment.

>I have resisted posting a comment on the latest barrage of Atari bashing,
>since I don't own anything made by Atari ...

You should have hung in there.

>I am amazed at some of the comments I'm reading in this newsgroup.

So am I. Few have anything to do with using or programming the Atari ST. Even fewer provide real information on any topic. Instead of comp.sys.atari.st, it should be noise.atari-bashing.instant-experts.

I don't see this noise from the many folks who have made this newsgroup worth reading over the last few years. I see it mostly from November locusts who have just figured out how to post news but apparently have not learned to consider first whether their posting makes a material contribution or raises a question worth answering.

apratt and kbad and many others @atari.UUCP have devoted many hours to reading this newsgroup and answering questions. I hope this drivel-storm passes soon, before they conclude that it's not worth the effort.

Followups redirected to alt.flame.

>may not be a RSC to write to.
>
>3) Write to the PRG file. Best of all since you need it to
>run his program!!

No, no, no! Never write self-modifying code!

1. Self-modifying code is very bad style. It is difficult to write and even more difficult to understand. Programs that modify itself tend to be unmaintainable.

2. A lot of machines do not allow you to modify a program file for security aspects. Consider everyone on a multiuser system would be allowed to modify any file. Sure, this is not true for the Atari ST, but one should learn to do it the right way. Spend some time to figure out how to do it on e. g. a Unix system and you can to it equivalently on the ST. (Slight simplification here, but you got the idea, right?)

3. On a related topic: Several systems do not even allow you to modify your executing program while it is located in memory. You will only be allowed to write to the data portion of the program. This is due to the fact that on a multitasking system several tasks can execute one single program simultaneously. Now, if the program code can not be modified by the executing task it is sufficient to load the program into core only once, thus gaining a lot of efficiency. (Of course each program get it's individual data section.)

4. If you are afraid of virusses don't modify your program file. You (the average user) could never tell whether the program is modified by a virus or not. There are programs on the market (including the PD market) that estimate a certain checksum for each program and alarm you if this number changes. How could such a program tell if the change is due

to a virus or not?

5. If you are afraid of virusses write protect your media as
far as possible. A program that writes to it's program file
needs to be run from a not write protected disk. This a
unnessary and an avoidable security hole.

6. In the case you mention it is fully sufficient to maintain a
.CFG file. Simply write out the following items for each
button (or other object): index of root object, index of
object within the root object, current flags of the object.
Upon start of the program the whole stuff has to be read in
again and the object flags set accordingly. Simple, isn't it?

If you considered this a flame it may be turned off now :-).

>>4) DESKSET II
>
>Hmmm, I don't recall hearing this name before. What is "DESKSET", to say
>nothing of its sequel?

DeskSet was one of the first microcomputer-based commercial typesetting front-end systems. It predates laser printers, Pagemaker, and so forth. As I recall, it cost about as much as a car when it was first released. So did a PC in those days.

DeskSet II is a contemporary page layout system. As I recall, it uses Compugraphic Intellifont technology. My local Atari dealer has had brochures on DeskSet II since last winter, but there is no evidence that the Atari ST version has been released for sale. This is no major loss, since Calamus does such an impressive (and speedy) job, also with Compugraphic technology.

Compugraphic, currently a subsidiary of Agfa-Gevaert, is a company that makes medium-to-high-quality commercial phototypesetting machines (and some text editing systems). It has a large typeface library. In the last couple of years, it has begun marketing digital representations of those typefaces, in its own proprietary vector encoding as well as in PostScript format.

2113. TOS 1.6 && TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1989-10-27 09:13:19 UTC
From: alex@hpgnd.HP.COM
Message-ID: <4280003@hpgnd.HP.COM>
Source record: 247785

TOS 1.6 versus TOS 1.4

As we all know , TOS 1.6 is the OS of new STE machines.

And TOS 1.4 is what should have been provided with first ST machines...

TOS 1.4 gives much more than 1.2 (or 1.0) ,

- New file selector ,
- Move file function,
- MS-DOS disk format,
...

My question is quite simple ,...
Does TOS 1.6 gives the same new functions that TOS 1.4 ?
Are they compatible ?

In fact , Is TOS 1.6 an enhancement of TOS 1.4 ? or are they
two different branches of TOS 1.2 enhancement ? ...

Alex.

> it's reasonable to term either of those software bases "insignificant."
>
I would hope that Atari can release their version of Unix for the TT within a reasonable time period of the computer's release (unlike Commodore, which has promised Unix on the Amiga for years now). The availability of Unix applications would be a boon, but I doubt whether the average Atari user out there is going to bother with Unix unless it is made considerably easier to use. I'm not really sure the TTP configuration of the machine will actually support Unix (there does not seem to be any reason it should not). By the time a TT system is configured to run Unix, one will probably have to spend upwards of three thousand dollars to get a workable system (not bad for a Motorola based machine, but Apollo diskless workstations don't cost that much more). As I said, we'll have to wait and see if Atari can bring these products out in time. I'm not sure I can hold my breath that long, however.

2115. Bashing mania

Newsgroup: comp.sys.atari.st
Date: 1989-10-27 12:55:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8910280704.AA11592@ucbvax.Berkeley.EDU>
Source record: 247787

Seems no matter what Atari does, someone takes a shot. If Zenith, Toshiba, Commodore, etc. put out PC compatibles then it's OK. If Atari does it then they're comprimising their principles (witness the complaints over the Portfolio). If Commodore issued the Portfolio it would be visionary.

At least Atari insists on bundling their equipment with user friendly interfaces.

Critics praised the NeXT machine for its foresight in not putting the smarts in its laser - have the computer use its RAM. When Atari did this industry analysts complained. Double standards - you bet.

Everyone bitches about the TT being late. The Mac II has not been with us that long and Apple had a 1.5 year head start with the Mac over the original ST. The delay between the Mac and Mac II is now about the same as the ST and the TT (and in the same time frame, Atari developed and released their PC XT, AT and 386 line, the STACY, the Mega and the ATW).

Mac users tend to forget about all the bad years of infinite disk swaps, HD 20 to patch in a hard disk, the volatile hard disk directory problems (what do you think SHUTDOWN is for), opsys versions that changed every 20 minutes, etc. PC users have had DOS (enough said).

The ST community has had fewer nightmares than the other guys. Sure their are 386s and Mac IIs (how many in home use guys). The Mac may have introduced the computing world to user friendly interfaces but the 520/1040 releases made it affordable to the masses without endless disk swaps. Like others, I get upset about delays in the release of new Atari equipment. However, considering the great fun and productivity I have had with my machine, I can take a little bad with the good.

I suggest that the net start a new forum BITCH.COMP.SYS and that we chuck all crabbing (including mine against DOS) in there.

Have a good day Sam Tramiel, I'm having another great one with my ST.

2116. HP LJ IIP at $995

Newsgroup: comp.sys.atari.st
Date: 1989-10-27 13:09:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8910280704.AA11610@ucbvax.Berkeley.EDU>
Source record: 247788

Quoting the LJ IIP at $995 is like quoting a PC with 64K of memory. Both are useless since the LJ IIP has a mere 1/2 meg. What's the price with real memory.

I think Atari should run a series of ads throughout a TV program. At the start, they would announce that they would be printing DTP files from PC -> LJ, Mac -> LaserWriter and ST -> SLM804. Then they would start the printing. After 5 minutes, a quick commercial break would announce that the ST has finished all 5 pages, the Apple is on its second and the PC... just hang in there. By the end of 15 minutes they could announce that the Mac had wrapped up and wait, wait wait... the PC-LJ combo seems to be giving us the first page. Well, you get the point. Go buy a LJ and hook it up to your parallel port. If you really believe that 2 pages a minute is anything but ASCII or the rate for multiple pages once the printer has received its image that took 15 minutes to receive then I have some nice lakefront property in the Northwest Territories for you guy.

2117. QIC 02 interface? (connecting a cartridge drive to an ST)

Hi!

I have a 1/4 " cartridge drive which I want to hook up to my Atari ST.
This drive has a QIC 02 REV D interface.
I was wondering if
- anyone with an ST has done this before?
- there is a company selling converters from QIC 02 to either SCSI or the
parallel port (I do have a ACSI to SCSI board)
- anyone can supply me with a pointer to a build it yourself article.

The software is not going to be the problem. However the hardware is a
little more difficult for me.
Would it be enough to be able to access all 16 interface lines from
the computer, and do the rest in software, or is there more required??

I finally broke down and bought DM and a hint book. I have managed to get to level four.

Does anyone have any information about the history of the development of this program? I am amazed that anyone udertook such a project. That they made it work is incredible. That it fits on a single sided disk is clearly impossible!! The amount of detail in the dungeon, the sounds, the response time, the pictures, et cetera boggle my mind.

This has to have been a labor of love. I would really like to know something of how it came about and be able to express my respect to the authors for their accomplishment.

2119. Re: TOS 1.4 Incompatibility List: zoo

Newsgroup: comp.sys.atari.st
Date: 1989-10-27 14:35:21 UTC

>I am concerned about the fact that programs work for some people under
>TOS 1.4 and not for others. Either (A) the program is different or (B)
>the TOS is different.
>
>People, the only official TOS 1.4 release is dated 4/16/89. You can
>see the date in the ROM by dumping offset $18 from the start of the ROM
>(which is $FC0000 on ST, but not STe!) ... you should see the date as
>four hex bytes: 04 16 19 89. If you don't see this, you don't have the
>right version.
>
>You should GET the right version: the old ones are inferior, and the
>incompatibilities which caused some of these programs to fail might
>have been fixed in the released version - that would explain a lot of
>this confusion.
>
```

I just received my TOS 1.4 and the date on it is 4/6/1989. Now last night when I installed it I was unpacking rainbow.uue and then archiving the newly unpack directory with zoo (which saves directory structure -- great for backup with turtle).

Anyway I think I found a YABEE (yet another bug eeeek!). I have been using Developer's TOS 1.4 (8/8/88) for months now with no trouble. All my archives done with the latest zoo are fine. However I found last night that ANY archive built under EPROM TOS 1.4 (4/6/89) fails to test correctly.

Here is what I did to generate the problem repeatedly:

```
(rom TOS 1.4 -- 4/6/89)
zoo -backup snert snert\*
zoo -test snert
(received multiple CRC errors)
(reboot under Developer's TOS 1.4 -- 8/8/88)
zoo -backup foobar snert\*
zoo -test foobar
(archive ok)
zoo -test snert
(archived still f....d)
(reboot under rom TOS 1.4 -- 4/6/89)
zoo -test foobar
(no problem)
```

Now this morning I read the above comment about TOS 1.4 version date. Why is Atari Canada getting eproms from the states with eproms that

are 10 days older than what Allan says is acceptable? Is the bug
I'm experincing due to zoo? or TOS 1.4 (4/6/89)?

- Ant

PS. I was so happy yesterday -- it was like Xmas, I did well on my
Japanese mid-term, I received my Word Perfect update and TOS 1.4 on
eprom. Then after midnight I find this annoying tit bit and it is
still 4 days before Halloween!!!

Hello all,

My Mega2 ST was sent off to my dealer for TOS 1.4 installation. I am now forced to type on a MAC SE with its loud clackity clack keyboard, itty bitty screen, and slow hard drive. I hate this thing!
Anyway, could someone prepare a list of what typical programs should be removed from the /AUTO/ folder and what new programs/patches should be installed? In other words, I'm using TopDown now. I assume it should be removed. What about the 40 folder bug fixer program? Can I take it out now? ETC., ETC.,... Now then, what programs should be installed?
Many thanks, and please, let's get off the bashing ATari for a while. I'm also pointing fingers at myself. Experience with Atari proves venting steam doesn't do much good. T & Company are going to do only that which they want to do.

The bandwidth that counts is that between the user's head and the
program.

Hmmmmm.... You just reminded me of an idea i've had kicking in my head for some time. At one point, I almost wrote to FTL asking them to publish a full sized book on DM. This would be complete with source and flowcharts. The advantage to this? I am -positive- that half of all hackers for the ST would be willing to shell out $30 for this book. Lets hear it. Anybody else for a letter writting campaign to FTL?

There is a printer spool program in Abacus' ST book, _Tricks and Tips_.

They give you the source, and all you really have to do is type it in (make your own modifications/improvements if you're into that sort of thing), and compile (or assemble it.. I can't remember what it's acutally written it. Either C or Assembly, probably).

I haven't played with this, so I can't really say how good it is. You may not even want to go to the trouble of typing it in.

But there's my two cents worth.

Marc.

I am thinking of buying a turbocard for my Mega ST 2.
I would like to hear from YOUR card. Information like
what machine (1040, Mega), TOS-ver, Blitter/no blitter,
QuickIndex15 results, compatibility, needs soldering,
can't go in rev. xx -board, price (naturally) is very
wellcome.

Generally send me anything, I will compile the results
in (hopefully) humanreadable-form and mail it to the net.

Please include a address of the dealer you have bought your
turbocard.

Thanks,

>up with some "clever" scheme to make sure you don't clobber something
>useful (like executable code) in your binary. Whatever you come up
>with will likely be non-portable as well.

I use MicroEMACS 2.19, a small, fast text editor. I wanted to save the
margin settings and a few other characteristics, but having to load a
configuration file (a) slows down program invocation, and (b) provides yet
another opportunity for something to go wrong, i.e., the configuration
file gets lost.

I remembered an old CP/M communications program called MEX that had the
ability to "clone" itself -- to write a modified version of the running
program back to disk.

So I whined at Dale Schumacher, who was handling the MicroEMACS
modifications, until I got him to add such a feature. I assume that it
indeed is nonportable, but is set off by #ifdef ATARI_ST in the source
code. I don't know any details about the technique. Perhaps Dale can be
persuaded to describe it.

>Sorry to rain on your parade, but "Just the facts, ma'am, just the facts".

Sorry, but you are missing the essential point:

those above programs are creating self-unpacking loadable files, and
the unpacking algorithm has to (and can !) compete speedwise with
HD read times!

Compress is a much simpler program (yet still recommendable for
archiving)

[responding to a question about TT multitasking]

>Nope, it does NOT multitask.

J. Townsend has announced that 3rd party Unix will be available "RSN".
Unix multitasks. It's entirely possible that David Beckmeyer could
produce a TOS multitasker that could multitask as well on the TT as
MTC does on the ST. However, multitasking ST programs in general is
quite a complex problem.

The TT has 2 markets:

1) Upgraded ST -- singletasking, runs GEM, fast.
2) Unix box. System V binary-compatible, nice fast colour display,
ram above 2 megs uses burst cache fill so it's relatively fast.
This is the future.

> This has been mentioned by John Townsend et al
>on GEnie in the past.

John also talked about Unix. Unix multitasks, eh?

> The TT will simply be a faster ST with slightly
>better graphics.

To market # 1, TT will be this. It's an upgrade path for the ST. For
market # 2, the TT will be quite different. It will be a box capable
of running Unix programs distributed as source as well as 680x0 binary-
standard applications. Instant software base.

I hope that Richard doesn't buy one so that he won't tell us all about
it. Actually, I wish Richard would benchmark TeX on his SLM804 against
an HP Laserjet and then tell us how bad the SLM804 is.

>I would hope that Atari can release their version of Unix for the TT within
>a reasonable time period of the computer's release (unlike Commodore, which
>has promised Unix on the Amiga for years now).
No. Amiga hasn't given a shipping date for the US. They have repeatedly
said that they are working on it and they have repeatedly implied that it
will NOT be out in the US until the Amiga 3000 ships. When is that? They
refuse to say, since this is a ground-up, all 32-bit project - not at all
the same as just dropping a 68030 into an Amiga 2000 or 2500.
If you want Unix right now, go to Europe.
>As I said, we'll have to wait and see if Atari can bring these products out
>in time. I'm not sure I can hold my breath that long, however.
Last time I went shopping for a computer, I looked at the Atari ST
line. It didn't win out. I keep hoping that Atari will put its stuff
together and help prevent IBM and OS/2 from owning everything. (That's
why I read this group, by the way). I'm also not holding my breath.

I share your enthusiasm for the sudden media activity by Atari (though in truth I can't get very excited about the product - doesn't seem to be aimed at me, seems to be aimed at DOS people). However, in the interests of net bandwidth, & c., and since this is a non commercial network supported in part by public money, could perhaps we have just a precis next time, and not the entire text of the advertisement?

BTW, it ran in the Globe & Mail, business section. In Canada, that's like running in the Wall Street Journal (IMHO).

>basically the first two
>arguments were passed in registers! Is this true?

From memory:

the first 3(?) integer-type arguments in registers do,d1,d2 and/or
the first 2(?) pointer-type arguments in a0 and a1.

The TC-specific keyword 'cdecl' allows you to disable this, so
you can link to libraries compiled with Alcyon (or generate functions
with will be called by the AES !).

Integer-type return value are in d0, but pointers are returned in a0.

I never use floating point, but I know that TC ST has quite different
floating point formats in version 1.00 and 1.10, 1.10 supporting the
IEEE standard.

I know that You believe You understand what You think I said, but
I'm not sure You realize that what You heard is not what I meant.

>o What is the minimum (ie least expensive) ST configuration that will allow
> me to be (disk-wise) compatible with the most ST systems ?
Any ST with a double sided drive (ie: a 1040ST or a 520ST with a secound DS drive). 1 meg of memory (ie: a 1040ST or a 520ST with a memory upgrade) is required for some software.

>o Will I also need a single-sided floppy drive to be fully compatible with
No. A double sided drive can read, write, and even formate a single sided disk.

>o Can I use a standard composite input monochrome monitor with the ST ?
The ST video is analog RGB. ST monochrome monitor scan frequency requirements are a bit so you will either need a multi-sync monitor or the Atari monitor.

>o Can I do a sysex load/dump in BASIC (which I assume comes with the machine),
> or will I have to buy a C compiler ?
Someone else will have to answer that. I don't know anyting about sysex.

>o Anybody got a used one they want to get rid of ?
I'd like to keep mine thanks :-). Occasionaly one for sale gets posted here, just watch this newsgroup.

quick st is NOT a double click product. it's a completely seperate shareware
product from the double click shareware stuff. anyways, when i received
paul's message about pmfs NOT working without quickst, i was astounded. finally
software which needs quickst!!!! :-)

whenever i get a bit of time i'll have a look at pmfs. it sounds like an
excellent idea and since we have plenty of room on our sun harddisk here
at work, it would be great to back up the megafile 60 to the sun harddisk
at will.

I got this in the mail, but could not reply. The info might be of interest to
others.

-BW

> Subject: Deskjet SOFT fonts
>
> I'm wondering how to get a copy of this ' Deskjet Software Developer's
> guide you mentioned in rour reply on my call on the ATARI DIGEST.
> Has this publication a HP Partnumber , so I can order it form the
> local HP sales office in the netherlands ? I called this office, but
> they say they'd never heard of this publication.
Sorry about that, but this document doesn't exist. I have a paper called
'DeskJet Softfonts & Softfont File Format' that I received from the
DeskJet manufacturing division early this year. At that time, I was told
they didn't want distribution of this document outside of the company.
In the purpose for this document it mentions the Developer's Guide.

That's the bad news.

> Since You're using an account on a computer at the HP labs, maybe you
> know addresses of people in the HP organisation who can supply more
> info.

Now the good news.

I called the number I posted, pretending to be a customer (that way I don't
accidentally get info that I shouldn't share, you know, industrial espionage
is pretty rampant here in the computer industry ;-) and was referred to another
number at the DJ division. I continued to pretend I was a customer looking
for info on Softfont specs. A woman there said she could send me a copy of
the Softfont File Format I mentioned above. If I could get it without ident-
ifying that I work here, I'm sure you can too. Call your sales office and
asked for 'DeskJet Softfonts & Softfont File Format' dated 12/30/88. If
you run into a deadend, you can try the number I was given for the DJ support
in Vancouver, Washington: (206)254-8110.

> I am curious to know what software (is it PD ??) you're using to use
> LaTeX on the ST. I got some stuff, but it wouldn't work.
Yes, it's PD. I have the files but haven't tried them out yet. My hard-
disk is getting pretty full and I'm waiting to do a complete backup before
purging enough space to hook up this LaTeX stuff. It's all ftp-able from
various places here in the states. The files I have are:
640009 Oct 5 10:24 StTeXbin.zoo
674188 Oct 5 10:27 StTeXmac.zoo
280372 Oct 5 10:33 StTeXsrc.zoo

```
83007 Oct 5 10:39 StTeXtfm.zoo
110969 May 19 14:49 djfonts.arc

Message-ID: <2456@umbc3.UMBC.EDU>
Source record: 247713

I haven't used my ST in a long while, so if this request sounds nieve,
thats because it is!

Could someone suggest some standard combinations of the many fixes/patches/
gdos suppliments + font enhancers etc...
Reading this newsgroup, one gets overwhelmed by the pleathora of
auto-booting fixes to choose from. ie. Turbodos, Neodesk, FOLDRXXX, Gplus,
CACHEXXX (?) ... I probobly murdered the names of those titles, sorry!
I realize that much of this is simply a matter of taste, but I think
new users could greatly benefit from the experiences of the established users.
Also, your system configuration will have a lot to do with what you use, maybe
this could be catagorized as hardrive vs. no-hardrive ??
I'll post any results I receive, for those interested.

Thanks in advance,
Daren Daren@umbc5.umbc.edu

I've been working with my school's UNIX computer and I've found my meaning in life. I really really really like UNIX and would like to use my Atari as a terminal. Those green and black jobs just don't hack it. Are there any Unix-specific utilities that I can use to make my ATari a mini-Sun? I've heard of uw (Unix Windows), but are there other utilities I can use?
If Atari comes out with the TT, what "brand" of UNIX will it run? Will it be just like SunOs (Unix) ? If so, I can hardly wait!

2143. Quick ST 1.6 Press Release

Newsgroup: comp.sys.atari.st
Date: 1989-10-27 21:34:22 UTC
From: w-darekm@microsoft.UUCP
Message-ID: <8251@microsoft.UUCP>
Source record: 247715

Press release for immediate distribution to all Atari ST Users in the
United States and Canada.
Friday, October 27, 1989

Quick ST 1.6 -- Shareware by Darek Mihocka and Ignac A. Kolenko

TOS 1.4 is now available. TOS 1.4 is great for speeding up file operations on hard disks, but compared to earlier versions of TOS it does very little to speed up screen operations. Regardless of which TOS you have, the program Quick ST 1.6 is for you.

Quick ST 1.6 increases the speed at which the ST performs screen operations, such as printing text to the screen, scrolling the screen, drawing windows and dialog boxes, and reducing the overhead of other graphics operations, such as desktop redraws.

Printing of text strings to the screen is sped up by 1510% in medium resolution and 1240% in monochrome. Character by character printing is three times faster. Screen scrolling is at blitter chip speeds. This all means that your .TOS and .TTP programs will run faster. Line drawing is twice as fast, which makes zoom boxes and windows draw much faster. Graphical text is printed much faster, which means that your desktop windows will update faster and your GEM programs will operate faster.

The result is that your Atari ST appears to run faster and smoother than before. You spend less time waiting for the screen to scroll or redraw. Quick ST 1.6 does not physically make your ST any faster. It simply makes TOS more efficient at manipulating the screen display. In some cases, it will make your ST perform better than an equivalent ST equipped with hardware enhancements like a blitter chip, 16 MHz board, or even TOS 1.4. And all this is done in software, so installation is as simple as copying a file.

Quick ST 1.6 runs from the AUTO folder and so does not use the already overcrowded desk accessory menu, or require interaction with the user. It is completely transparent to most applications. It uses under 20K of RAM, and automatically installs either the color or monochrome version and throws away initialization code to save memory.

Quick ST 1.6 runs on any Atari ST or Mega ST using a standard SC1224 color or SM124 monochrome monitor. A blitter chip is optional, as is an accelerator board. All official releases of TOS are supported.

The following screen resolutions are supported:
- 320x200 low resolution

- 640x200 medium resolution
- 640x400 monochrome

Here are some benchmark results using the Quick Index 1.6 program, running on a TOS 1.4 1040ST, in monochrome, with no blitter chip:

BIOS text 325%
BIOS string 1240%
BIOS scroll 134%
GEM draw 193%

These numbers are greater than those obtained for an ST not using Quick ST 1.6, but equipped with TOS 1.4, blitter chip and 16MHz board. When used with Quick ST 1.6, such a system is amazingly fast.

In another benchmark, the entire Quick ST source code (9000 lines of 68000 assembly language) was loaded into ST Writer 3.4 and scrolled from top to bottom. Without Quick ST, this takes 90 seconds. With Quick ST, this takes 49 seconds, almost 100% faster. And ST Writer can keep up with your typing now when used with Quick ST.

Using the ZOOMTEST program supplied with Codehead's G+PLUS program, 50 repetitions take only 10 seconds in monochrome and 15 seconds in medium resolution, twice as fast as normal!

But don't take our word for it. Try Quick ST 1.6 for yourself...

Quick ST is shareware, and is NOT public domain. It is available for a $15 shareware registration, far less than the cost of a hardware upgrade, or even the TOS 1.4 upgrade. Because we believe strongly in the shareware concept, which allows users to freely distribute and copy software so that it may be tried out on the user's own system, we have made available a demo version of Quick ST 1.6. It can be found in the Atari ST libraries of Compuserve, GEnie, Delphi, BIX, and is currently also available on Usenet in comp.sys.atari.st.

If after trying the Quick ST 1.6 demo, you feel that it is of no benefit to you, simply delete the files and forget about it. If you do appreciate the benefits of using Quick ST 1.6, simply send in your shareware registration fee (made payable to Darek Mihocka) and an updated disk contaning the full version of Quick ST 1.6 will me mailed to you. Quick ST 1.6 is not copy protected and installs on any standard boot disk.

Because we believe in and support user groups, we are offering Quick ST to all full time members of Atari ST user groups for only $12. We ask that at least 5 people from the same user group register, and you must provide proof of membership (i.e. photocopy of membership card, official member list, etc). There is no time limit on this, so please take the time to demo Quick ST at your user group so that every member can try it.

If you are already a registered user of the Quick Utilities or Quick ST (version 1.5 or earlier), simply mail your disk back along with $3, and the updated Quick ST 1.6 disk will me mailed to you. Do not bother to

download the demo.

Our mailing address for shareware registrations, questions, comments,
demos and updates is:
PO Box 2624, Station B
Kitchener, Ontario N2H 6N2
CANADA

Phone (in Canada): (519)-747-9452.

If you prefer to contact us by email, we can be reached at the following:

Compuserve: 73657,2714
BIX, Delphi, GEnie: DAREKM
UNIX: uunet!electro!ignac

If you are unable to obtain the Quick ST 1.6 demo by modem, simply mail us
a blank disk and $3 (or no disk and $5) and we'll send you the demo disk.

This shareware offer is valid until the next Quick ST update.

> the dust by IBM PC clones. And now that Commodore is producing an Amiga (A3000)
> which uses non-interlaced graphics, the A3000 is a serious contender in my
> book.

Amiga A3000? I haven't even heard of it. Can you buy one in the US now?
If you can't is it still a plan or do they have a prototype? How much
will it cost? What are the specifications? And what's so special about
non-interlaced graphics?

I have only heard of an Amiga A2500. It is has only a M68020 and is more
expensive than an Atari TT!

What makes the A3000 special that you would choose it over a TT, for
example? I doubt Commodore is supporting more than Atari...

>
> I would dearly like to get a good CASE tool but if you think I will

You could buy your non-games software from Europe, too. There is plenty
of it.

>

> a closed system like the TT/P. One lousy short VME card slot
> does not make an OPEN system. you need 5 or more. One slot
> just guarantees that no one will design for it. Lack of resources.

What do you need those 5 or more slots for. (And please don't answer:
"internal modems, hard-disks, etc", because that's only a cosmetic issue.)

By the way, I've read that Atari will bring the graphics card of the ATW
(which is quite neat) for the TT as a VME-card...

If you want to read a good ST-magazine you should try
the German "ST Magazine" (that's the name).

It is very informative and when you read it, you will see that there is
quite a lot happening on the ST-scene.

It's too bad that it's written in German. (I mean too bad for them who
don't understand the language.)

From: ericco@stew.ssl.berkeley.edu
Message-ID: <1989Oct28.001548.20290@agate.berkeley.edu>
Source record: 247719

Really Self-Modifying Data

Lisp systems typically have a 'dumplisp' function which dump an image of itself to disk. Thus, invoking the dumped lisp, returns you to the exact environment you dumped. This is easier to do in lisp since it treats its source code as data.

Although modify the executable file seems bad to me, I think that modifying the resource file is completely reasonable solution (and simple). By parsing the structure of the resource file, your program can quickly determine which parameter (object) needs to be modified. In fact, if your program uses text, then you should put the text in the resource file as well. This is how the resource file is supposed to be used. By putting the text in the resource file, non-English speaking people can replace it with meaningful non-English text.

2149. My problems with Atari.

Newsgroup: comp.sys.atari.st
Date: 1989-10-28 02:39:09 UTC
From: mikeb@tekfdi.FDI.TEK.COM
Message-ID: <3582@tekfdi.FDI.TEK.COM>
Source record: 247720

I do not like the way Atari decided to keep everything a secret
about the ST. The developer's documentation (which I have) is useless.
I am glad I didn't have to pay the hundreds of dollars the computer's
former owner had to pay for them. I wish that Atari would release a
complete set of manuals for the ST that anyone could buy like Commodore
did for the Amiga. In this way Atari could set standards that everyone
would follow.
The GEM operating system seems very clumsy to me. This is probably
due to the documentation on the ST being incomplete. I say this
because some VDI calls are not present and others simply don't work as
the DRI books say they should. (Remember v_opnvwk() and the work_in
array?) It's a good thing I got MWC because it had all of that in it's
lexicon.

I do have 2 suggestions about how to improve Atari's image:

1. Release a complete and accurate set of manuals that doesn't
cost $500.00 like the developers documentation did.

2. Take an idea for the NeXT computer. Bundle gcc and g++ with
the ST. This would be taken as a positive effort on Atari's
part since a computer is useless without software.

If Atari does not correct the problem with the bad documentation I will
buy another computer and it will not be an Atari. I simply will not put
up with inadequate documentaion. If this is corrected then I will buy
another machine from Atari with more memory since I do like the ST.

If anyone feels that they must send me flames please send them to the
address in my .signature since this is a borrowed account.

2155. Should I repost EDISK, my Eternal replacement RAM disk?

Newsgroup: comp.sys.atari.st
Date: 1989-10-28 07:09:10 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8910280708.AA12631@ucbvax.Berkeley.EDU>
Source record: 247726

Hello all,

I keep seeing the questions about various versions of Eternal working with TOS 1.4. To clarify all this: Eternal works with all TOS versions, it's on Mega 4's that it doesn't work.

I recently posted a RAM disk called EDISK that was originally based on Eternal but has since surpassed it by a wide margin (I'm confident :-). Unfortunately, the program hasn't reached many people. I only have two reports of people who received it.

My question now: should I repost the RAM disk? If so, where? Would it help to send it to Steven Grimm and the BITNET people separately? Comments and advice are most welcome.

2156. ICD hard disk driver V4.0 wanted

Newsgroup: comp.sys.atari.st
Date: 1989-10-28 07:09:32 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8910280709.AA12714@ucbvax.Berkeley.EDU>
Source record: 247727

Hello all,

is there anyone out there who has pulled the ICD hard disk driver version 4.0 off Compuserve and could kindly email me a copy? I'm a legal owner of an old version of the driver software, and I'm under the impression that the new version is available for all such owners without charge.

Unfortunately, ICD has never answered my letter about some tech problems (my Maxtor LXT1002 has 96.2 MB but can only be used with up to 92.2 MB) so I won't try writing again.

Alternatively, if the software is available on a server I can reach, I'd appreciate a hint as to the whereabouts.

As always, thanks for any and all help.

>>when i doubleclick on a file and choose "show"? ...

>ya, this is actually easier than you most people think. ...
> .... set the application mask to be
>what ever document you want to look at: ie: if you want to look at all *.C
>*.H, *.DOC and *.TXT files using TEMPUS.PRG, simply install tempus.PRG as
>the installed application and for each installation give it one the above
>search masks.

Ignac is perfectly right, but he doesn't follow his own advice to the limit.
Simply specify *.* as the seach mask, and the application you defined will be
invoked for *ALL* non-executable files you double-click on *EXCEPT* the ones
you defined another application for by specifying a file type.

Note that you must specify a complete path to your application (i.e.
C:BINEDITTEMPUS.PRG), and that you must be careful not to change the
DESKTOP.INF in any other way. So preserve trainling blanks and the Ctl-Z at the
end.

I even have a program that can make such changes in DESKTOP.INF on the fly
in the copy of DESKTOP.INF *in*memory* ||

Easy, eh?? :-)

Sorry Mike. The deal with Calamus is that, like Ultrascript, it uses outline fonts. If you want to use a Garamond face, you need the Calamus Garamond face, otherwise, Calamus will not be able to show you the output on the screen. Calamus takes care of all the "painting" of all the characters.
To use the Ultrascript fonts in Calamus, you need to convert the US font into the Cal font. This is unlike Fleet Street, which uses GDOS to do the screen display, but creates US output and lets US take care of the outline face.

Perhaps a more pertinent question: Does anyone here on the net know what the font encoding scheme for Calamus is? I can see how it would be relatively easy to convert PS compatible fonts into Calamus since they (presumably) use splines and things like that.

2162. blitter beaters

Newsgroup: comp.sys.atari.st
Date: 1989-10-28 07:40:43 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <10087@stag.math.lsa.umich.edu>
Source record: 247733

Just for my own curiosity, I downloaded the QuickST 1.6 demo and checked its speed with QuickIndex 1.5 (geeze. Sorry Darek, I've used this QuickIndex a number of times and still haven't registered with you. A check is on its way tho, honest!). So, some numbers from my Mega 4 with TOS 1.4 in EPROMs, in case anyone else is curious...

Abbreviations:
A - no accelerators
B - BLiTTER only
T - Turbo ST 1.6 only
TB - Turbo ST 1.6 + BLiTTER
Q - QuickST 1.6 demo only
QB - QuickST 1.6 demo + BLiTTER

For monochrome resolution:

	A	B	T	TB	Q	QB
BIOS text	91	99	298	298	307	307
BIOS string	86	91	1210	1210	1081	1081
BIOS scroll	98	129	136	142	132	132
GEM draw	100	135	211	233	158	177

For medium resolution:

	A	B	T	TB	Q	QB
BIOS text	92	98	320	320	246	246
BIOS string	87	90	1364	1364	1373	1373
BIOS scroll	98	126	132	138	129	129
GEM draw	99	130	175	211	115	156

For low resolution:

	A	B	T	TB	Q	QB
BIOS text	94	106	415	416	221	221
BIOS string	89	97	851	856	443	443
BIOS scroll	98	125	133	133	128	128
GEM draw	99	149	182	235	101	151

Dunno why column A doesn't just say "100" all the way down the line. Oh well. Also interesting to note that when the blitter makes a difference with Turbo-ST, the difference depends on order of activation. If you turn on the blitter first, and then TurboST, you'll get about 6% more speed than vice versa. (Turn TurboST on first, then the blitter...) [This quirk isn't visible above, obviously.]

Kind of interesting... Makes ya wonder how you could put up with text operations on an ST just out of the box. Things really do look real real slow, until you use one of these add-ons. Pretty hard to judge which one to use, though.

I'm kinda bummed, myself. Neither of these two programs work with non-standard screen sizes, so my Overscan switch is idling in the normal position. Oh well. QuickST1.4 worked OK with Overscan. I wonder why the restriction now? Also TurboST doesn't seem to like PinHead. My system freezes when PinHead is in my AUTO folder, if TurboST is loaded.

I s'pose I wanna comment on the numbers themselves, since I've gone to all the trouble of typing them in. Interesting to note that the BIOS text operations (Bconout, Cconws) done by both programs completely ignore the blitter. Also interesting that TurboST gains a few percent in scrolling when the blitter is active, but QuickST ignores it there as well. (Interesting, but not a very significant difference, to be sure.) Also odd how the different resolutions alter the speedups. Like, in monochrome, the blitter accelerates GEM draws by 35% all by itself. But, it only speeds up both TurboST and QuickST by about 20%. Then, in medium, the blitter accounts for only 30% by itself, but speeds up both TurboST and QuickST by about 40%. Funky Stuff there...

Hm. Does anyone else out there really care about this stuff? I'm pretty curious to see some numbers for the various hardware accelerators now...

Allan Pratt says:
>People, the only official TOS 1.4 release is dated 4/16/89.

Unfortunately, Atari Corp screwed around so long that a LOT of people got tired of waiting for Atari to finally come up with an update to the 1985 Operating System for the ST, and began "burning" copies of various versions of the TOS 1.4 ROMs...

Also unfortunately, not only your local "pirates" were among the disillusione Atari owners, but many local Atari dealers as well..

It seems that some of the "official TOS 1.4" releases available from your] local Atari dealer may NOT be the "official" (once they finally got around to it) release of TOS 1.4

>if I should wait for my new computer a bit longer, it's worth the effort
>because I can get it many times cheaper than from other manufacturers.

True... you can probably get a PDP 8 pretty cheaply now.. or maybe a
KIM-1 single board computer..

Unfortunately, Atari Corp seems to have an almost eerie talent for bringing
us yesterday's technology at today's prices..

If you wait (and wait, and wait, and wait) for Atari Corp to stop playing
"games" with PC pocket clones and video games and to begin seriously
addressing their neglected computer market, you'll probably also have one of
the few "nonstandard" computers left in the world...

Will your company's President approve a purchase order for "Atari Computers"
because they make the "third rate" video games in the world..?

Date: 1989-10-28 09:41:14 UTC
From: glk01126@uxa.cso.uiuc.edu
Message-ID: <111500047@uxa.cso.uiuc.edu>
Source record: 247739

Need help with the following code, I've been sweating it out for days, and can't understand why it works the first time it is called, but the second through nth times are iffy. Sometimes free is set to 0, sometimes to a valid count of free mem div 4. Malloc(-1L) after the first time it is called, returns some value less than 4096, but the memory is available to be allocated by other parts of the program...

HELP:
*free is set to zero before call.

```
/*****************************
Compute total free
memory
*****************************/
freemem(free)
int *free;
{
long kilo;

if (Malloc(-1L)>4096L)
{
kilo = Malloc(4096L);
if (kilo)
{
*free += 4;
freemem(free);
Mfree((char *)kilo);
}
}
}

/*****************************
Show free memory in
disk dialog
*****************************/
dial_free(list)
dualfile *list;
{
int free;
free = 0;
freemem(&free);
sprintf(rs_object[rs_trloc[DISK]+MEMOFREE].ob_spec+2,"%4dK, B:",free);
sprintf(rs_object[rs_trloc[DISK]+MEMOLARG].ob_spec,"%ld\0",Malloc(-1L));
sprintf(rs_object[rs_trloc[DISK]+MEMOFILES].ob_spec,"%d\0",
```

```
dualcnt(dualfirst(list)) );
dial_draw2(DISK,MEMOFREE,MEMOLARG);
dial_draw(DISK,MEMOFILES);
}
```

```
( dial_draw simply redraws the object in the dialog box,
dial_draw2 redraws the rectangle encompassing item1 and item2 )
```

Thanks a lot if you have any ideas... I really am on the edge of smashing something. Using Laser C V2.0.

It's not your fault. For a program to reallu work as an installed
application, it must be willing to accept the information given to it by
the desktop. Empire apparently does not do this. But what can you expect
from a company who tries to palm off old games as new.

>Has anybody seen or heard anything about Empire II? What's the latest version

I was wondering if i should post a message asking if PMFS even works.
I have tried the posted version on my 286 to a 520 and all the atari
side just locks up. With DEBUG defined i see that pmfsu is getting
checksum errors and re-trying. With the most recently posted version,
it gets a checksum, and then does not re-try. I have sent mail to
the author, but have not received a response. Has anyone been able to
get PMFS to work between a 286 with SCO Xenix and a ST? I tried can
do Zmodem at 19.2K, but i brought the baud down to 4800 with the same
results. I think that the 286 side is creating a P.disk with bytes
that are swapped as far as the atari end is concerned.

> I've got a cleaner version that the media change now works and I
> can also work at 19200 Baud now. If you're interrested, drop me a

Hmm... if breaking alot of old software with a new OS release makes Atari
a "minor league" computer company... what is DEC with their release of
VAX VMS 5.0 (followed quickly by 5.0-1 then 5.1 then 5.1-1). VAX VMS 5 broke
so much software (even some DEC things, not just 3rd party stuff) that it
was impossible to use for an awful long time where I work.

Just because an OS upgrade breaks things doesn't say the company isn't
doing a good job (of course with DEC it was easier to get fixed upgrades
to the broken software, but if I was paying thousands of dollars per
application program... I would expect INSTANT bug fixes too).

I hear that there will be two versions of the tt:
one "tower" model very much reminicent of the model 80 and another
"desktop" model....
Apparently, the tower comes with more memory than the desktop, and maybe
a larger hard disk.... that's nice.

but my father read me aloud an ST-World article about this infamous computer
where I thought i heard this:
THE DESKTOP MODEL WILL NEVER WORK WITH UNIX
only the TOWER will....

if this is true, WHY?????

In what other ways will the two versions be non software compatible??

People still buy ST's and MAC's, they are much the same technology
(exept that a low-end ST runs faster than a low-end MAC, and has better
graphics etc...). Today's prices for ST's are still cheaper than for
comparable MAC's (much cheaper if you take the street prices).
>

> the few "nonstandard" computers left in the world...

Do you think introducing a PC-pocket clone is playing. Many people
really want to buy one. Do you mean that Atari should only introduce
computers - not video games? I think it's nice that a company can bring
up many different kinds of devices. Do refer to the TT as nonstandard?
Is UNIX not a standard?!?! What about all the ST programs there are??

Haven't you heard of the Stacy and the ATW? They are not video games.

> Will your company's President approve a purchase order for "Atari Computers"
> because they make the "third rate" video games in the world..?

I certainly would not work for a company that has such a President! I
don't really like prejudiced people. And I know many companies don't
care how much their computers cost - they just follow the ad's and keep
up their "image". (I think it's much the same as buying expensive
clothes.) There are brighter companies, too...

And by the way, I don't think I'll work for a company at all. I don't
want to be ruled by stupid people. Perhaps I'll be a freelancer or a
free artist or something... (If I will not find a company useful and
interesting enough.)

I don't like that computers are being used to "make profit" etc.
(Well, I guess this was a bit too "politic" for this newsgroup....)

In a rather lengthy and meandering article, (what was his point anyway?),
<211@fjcp60.GOV> winston@fjcnet.GOV (Winston M. Llamas) writes:

> ... In many ways,
> I got what I paid for - a lack of programs that I'd really like to use.

This rings a bell for me. I remember some advice that I got from
John Bear, in his delightful book "Computer Wimp", he lists "166
things I wish I had known before I bought my first computer".

Point number 25 says to choose the software before you buy the hardware.

I think he is absolutely right, and his advice helped me to buy the
Atari I now have. I got what I wanted, APL.68000, and am still happy
with it; it is the highest level programming language I know for
any micro, and is almost the fastest implementation of any APL for
any micro. Of course, I have been delighted to see certain other
good things come along... for instance, UNITERM, Gulam, and Maple,
but the point is still the same:

Pick your software first, then but a machine that runs it.

I stand corrected, as far as Commodore promising Unix for years now. It's
too bad every Amiga magazine has to talk about it for years now, but that
rumors and announcements are not synonymous.

While it's nice to see Atari and Commodore making Unix available on their
32 bit machines, I think it's equally important that these guys are able
to support their products in earnest. Considering how long it has taken
Atari, for example, to make an OS upgrade available to its users, I'm not
sure that their version of Unix will be that much better supported.

>In article <4675ca0d.14a1f@force.UUCP>, covertr@force.UUCP (Richard E. Covert) writes:
>> which uses non-interlaced graphics, the A3000 is a serious contender in my
>> book.
What he's talking about is the Enhanced Chip Set for the Amiga. ALL
Amiga systems will be able to use them - the A1000 will require a special
daughterboard (third party). They provide several new video modes, including
high-resolution (704*480 with overscan) non-interlaced, 1280*480 SuperHires,
ChromaKey (the thing that lets weathermen walk in front of their weathermaps),
and some other new features. All high-res modes on the current chip set
are interlaced, for compatibility with NTSC and PAL video systems - one
of the original design goals of the Amiga. However, this can cause a
problematic amount of flicker if you don't buy a de-interlacing or high-
persistance phosphor monitor.
>Amiga A3000? I haven't even heard of it. Can you buy one in the US now?
>If you can't is it still a plan or do they have a prototype? How much
>will it cost? What are the specifications?
Commodore-Amiga will not give information on the release date of the
A3000. Some specifications are known; 68030, 68881 at 33 Mhz (I think);
ECS; full 32-bit system path up and down the line. Observers guess at
release dates from 1Q90 (don't bet on it) to 4Q90 (safe bet, IMHO.)
>What makes the A3000 special that you would choose it over a TT, for
>example? I doubt Commodore is supporting more than Atari...
With all due respect, I think it is a safe bet that C-A support
is better than Atari, Inc. support. I suggest you verify this on your
own, of course, but as a benchmark; AmigaDOS 1.3 came out a few months
ago. It came with a 1/3 inch thick supplemental manual detailing all
changes and additions made to all commands.
I got my copy from a dealer for $15.
They just released a maintenance upgrade - 1.3.2 - for free.
You may also wish to compare co-operation with developers, telephone
waits on customer support lines, advertising support, and so on.
This isn't to say that C-A support is perfect; far from it. But you
can always tell that they're trying very hard.
>What do you need those 5 or more slots for. (And please don't answer:
>"internal modems, hard-disks, etc", because that's only a cosmetic issue.)
Multiple graphics cards, GenLock card, processor upgrade, RAM additions,
new and different networking cards and disk interfaces, second (third, etc)
parallel and serial cards, systems control, etc, etc.
- R'ykandar.

Source record: 247653

Actually, I remember reading shortly before the 2500 came along that CBM had officially announced the 2500UX, which was basically to be a 2500 with 5 megs of memory, a larger HD, and a tape drive. I know the 2500's have been in developer's hands for a while. I think the major delay is inthe fact that CBM decided to change the hardware to a 2000 with a 25MHz 030 board, and there was a lot of retesting & redesigning to do.
Sorry if this message came out a little garbled.... I'm not doing a full vt-100 emulation here & it makes editing a little exciting...

Well, AD/DA cards, interrupt cards (for process control), parallel output
cards, co-processors (i.e. high-speed DSP's, _Transputers_, an 80386 machine
for doing DOS if you must), and probably some I can't think about.

From: dle@cory.Berkeley.EDU
Message-ID: <18908@pasteur.Berkeley.EDU>
Source record: 247656

Hi,
I have obtained a copy of the sources of GNU C++ but I don't know how
to make an executable for C++. Do I bring the source to my ST and make it
right there. README says that I need to have either as from SUN or gas (GNU
assembler). Does this mean that I have to get gas also?
Your help is appreciated.

Anybody else interested in this game? I don't know about mail- or ftp serves carrying it (there are no ftp sites in Germany yet, as far as I know. See the constant moaning from Europe when someone announces a great tool that's available via anonymous ftp). If interest warrants AND the stuff is not copy-righted too strictly, I could submit it to Steven for distribution in comp.binaries.atari.st. Otherwise, maybe I could mail, if there isn't a flood of requests.

So long, netland.

Message-ID: <89Oct29.073952est.57358@ugw.utcs.utoronto.ca>
Source record: 247660

Yes, Calamus will sort-of work with Ultrascript, but I wouldn't try it if I were you. Calamus will dump a raster image of a page to disk in PS format, but you still will have to use Calamus fonts, and it could take hours for Ultrascript to process the disk files.

The Calamus Compugraphic fonts are cheap compared to professional Postscript fonts, and there are probably over 50 PD and shareware Calamus fonts floating around.

2191. For Sale: 1 Meg M/IO for Atari 8-bits

Newsgroup: comp.sys.atari.st
Date: 1989-10-29 22:07:42 UTC
From: parsons@b.ee.engr.uky.edu
Message-ID: <13080@s.ms.uky.edu>
Source record: 247663
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

For Sale:

1 Meg Multi Input/Output Board from ICD

Features:

o 1 Megabyte of Memory configurable as RamDisks or Printer
Spoolers

o Parallel Printer Port

o RS-232 Serial Port

o Small Computers Systems Interface (SCSI) for connecting Hard
Drives

o Expansion Connector

Also included is an adapter for a 130XE. This also gives you
two cartridge ports instead of one.

Price: $300 for both. You pay shipping.

ICD currently sells this for $469.95, no discounts, and that
doesn't include the $19.95 adapter.

I can be reached at (606)276-3375. If I'm not here the answering
machine is. My address is:

Greg Parsons
222 1/2 Reed Lane
Lexington, KY 40503

Well, I still don't think you'll need that many (over 5) slots. It would be nice if the TT/P had more than one slot, but that would certaily raise its price. You could wait for the TT/X (I think it'll have more VME-slots). I think it is nice that there are options to choose from. If you want a cheap 68030 machine you can buy the TT/P. And it is possible that there'll be some slot expansions, too. (You can build the Mega ST's VME-bus for the 1040ST's if you want now.) And some of the devices above could be connected otherwise than in the VME-slot. If you can afford using all those devices at once, you certainly can afford buying a more expensive host computer!

I am a bit confused of the three TT's. Will there really be three models: the TT/P, the TT and the TT/X?

The german magazines I've seen have only written about the TT and the TT/X. The price for the TT will be DM6500 with a monochrome VGA-monitor and a 30MEG hard-disk. The TT/X was estimated to cost about DM10000 (or over).

The british magazines have written about the TT/P which would cost about 1300 pounds with a 60 MEG hard-disk and a monitor with resolution of 1280x1024 pix.

I wonder how the difference in the prices of the TT and the TT/P could be so big. (Even if the prices are for different countries). (According to my countings, the TT price= at least 1.5x the TT/P price.)

I would like to get some confirmation about the prices and the specifications. (I bet somebody else would, too.)

While testing some software I managed to screw up the root directory
on one of my hard disk partitions. The drive in question is only used for
backup so all files on it are contigious. I can find the subdirectory info
useing a disk editor and it looks like it's all there so all I need is to
write a program to read a directory entry and write the data to a new file in a
different partition. I can write a program to do this but don't feel like
reinventing the wheel if I don't have to. Anyone know a PD or for sale program
that will do this?

I bought my copy of TOS 1.4 from L&Y at the Washington Atari fest on Oct 8th (a 12-hour drive from here), and location $FC0018 reads 04 06 19 89.

What gives Allan? BTW, Bob Brodie brought some TOS 1.4 sets up to Washington for "one of the dealers". if it was L&Y (the other was Best) then I think something stinks.

Also, I left a message to Bob on your BBS in Sunnyvale some time ago which was not responded to. I asked if I had a 1/6th illegal copy of TOS 1.4 since (after a 12-hour drive back) when I tried to install these chips, I found that my set contained L0, L2, L2, H0, H1 and H2 but _NO_ L1 chip. Fortunately, I was not the only one to buy a set, so I made a copy of L1; so L1 is nicely surrounded by official PROMs (maybe this is why I can't set the AUTO option on NeoDesk without causing crashes; it works OK if I start NeoDesk manually) :)

Pierre Fortin

P.S.: Can you (or anyone at Atari) put DB into Sig 11 on your BBS? Thanks.

2197. Re: TOS 1.4 Incompatibility List: In europe only?

> reflect those of Atari Corp. or anyone else. ...ames!atari!apratt

Now I'm really concerned that Atari (including Sig Hartmann and Bob Brodie) were no more than 25 feet away from two vendors at the Washington Atari fest (Oct 7-8), one of whom sold me a copy of TOS 1.4 which contains the values 04 06 19 89 at location $FC0018. Bob even told me that he brought copies of TOS 1.4 to Washington for one of these vendors... ???????

Pierre Fortin
Flip-top PC-clone cases make great Hard Disk and 5.25" floppy enclosures. Now if Atari would only change HDX to support multiple drives (yes this was documented in the SH204 docs!).

2198. ATARI ST fan

I just got some personal mail calling me an asshole for
"bragging about your MacII or whatever.."
For others who have perhaps conjured up the same impression:

My set-up:

June 1986 1040ST TOS 1.0 1 meg RAM
85 MB Quantum
Mono and color monitors

Waiting for the TT.

I am an avid fan of the ST. I do NOT see it
as a game machine, as many others do. I use it for my
business on a daily basis. It has yet to need a repair.
COnsidering it has been on for several years and is hammered on
daily, i have to think it is a fine piece of machinery.

I like what it can do, my only wish is that it could do it
faster. I hope that if and when the TT becomes availible, it
can sustain the perfomance demands my business is now making.

386? UGH! MacII? Ugh! Who needs them.. I want my TT/P
^^^^^^^^^^^^^^
There's a melody that goes with that...

I guess we could get Sting to endorse ATARI and do the ad...

> appears on the destination disc.
>

I wonder if even Atari had some problems... I have an old 10 meg drive which
I formatted with AHDI V3.01 (I just use that drive for testing). Something
interesting happens with the formatter: while it is happily telling you
that it is checking your hard drive for bad sectors, the drive head does NOT
move from track to track. The head actuator in my 10 megger is completely
out in the open which is how I know this. Actually, the head stays near track
zero for a while, then jumps about 25% of the way out for a while, then 50%
(I am guessing) and one or two more times (I don't recall).

The point here is that there is NO WAY that the formatter can be checking
the drive as it claims. If it IS, then I want to know HOW it could be reading
about 3 megs into my Mega *2* to check. Also this "verify" must be SUPER-FAST
at reading the HD since the head moves across the tracks as fast as a normal
"seek".

I wonder if this is why AHDI V3.02 is now out without any docs and only the
formatting program is changed? I haven't tried it out yet...

Hi there,

there is one thing, I don't understand. Everybody is complaining
about the bad support of ATARI/US. That is well-known, even here
in Europe. So why do you all spend your money on writing such
aggresive letters to e.g. Andrew Semple, where you insult him
for his oppinion?

Save your money, because everybody else knows that the ones who
are now making lots of noise about the 'non-existing' TT's, STacy's,
and Portifolio's are the first in the stores to buy them.

Any flames are welcome. I'll buy my TT for sure.

Carsten.

2206. STe Incompatibilities (Was: TOS 1.4 Incompatibility List)

Newsgroup: comp.sys.atari.st
Date: 1989-10-30 13:55:50 UTC
From: colas@trinidad.inria.fr
Message-ID: <275@mirsa.inria.fr>
Source record: 247678

In article <1751@atari.UUCP>, apratt@atari.UUCP (Allan Pratt) writes:
> colas@trinidad.inria.fr (Colas Nahaboo) writes:
> People, the only official TOS 1.4 release is dated 4/16/89. You can
> see the date in the ROM by dumping offset $18 from the start of the ROM
> (which is $FC0000 on ST, but not STe!)

I have brought a lot of confusion with my message, and I want to make things clearer:

1) I do not want to flame Atari or Alan Pratt, who is doing a good job monitoring this group. I just want to gain information (and I think I succeded :-))

2) My only concern is that I want to replace my STf by a STe. I only want to know if I can by it now or I must wait 3/4 months before the software I
want to use is upgraded for the STe.

3) I saw in a french magazine (Joystick hebdo) that they tested DM, Falcon, Populous, Laser C etc... and they did not work on the STe!

4) I spoke to a ST retailer (NASA) who had a STe in shop and confirmed it to me

5) I assumed that these incompatibilities were due to the TOS 1.4 installed in the STe (In fact, it is a newer "TOS 1.6" which is sold with the STe, but I was told it only differed from 1.4 for sound with the new chip)

6) So I ran home test for myself these facts on my copy of populous with a disk version of TOS 1.4... If I cannot run Populous on my machine, I might as well buy an amiga (I'm serious here) I was so suprised that nothing had yet filtered on this newsgroup that I wanted to post a message to make some light on this subject.

So, as many people with first-hand experience pointed out, I WAS WRONG, but now the question is WHY:

- is the STe really very different from the ST (as the change in ROM adress seems to indicate), and incompatibilties stem form hardware differences, not from TOS versions?

- is TOS 1.6 the culprit?

- do these softwares run only with ROM tos, and not on the disk-based version

- Are these only rumors spread by the amigoids? :-)

| You should be able to FTP from either Terminator or Um1.mich.edu. The Ctex has
| both plain Tex and LaTex in it and it's zooed files so all the directory are
| presevered.

I do not have access to FTP but some kind soul already got the above for me. I am having trouble getting CTeX to run. First of all, it does not echo anything to the console; all goes to a file called TEXPUT.LOG. So I never know if it's asking me a question. Here's the output produced:

```
This is Common TeX, Version 2.9 (preloaded format=lplain 88.10.15) 0 ^L^@^C 2028 00:00
**&LPLAIN A:/SAMPLE.TEX

! Emergency stop.
<*> &LPLAIN A:/SAMPLE.TEX

! End of file on the terminal

No pages of output.
```

If anyone has any suggestions I would sure appreciate them, posted or e-mailed. It seems that the version I have comes from Jwahar R. Bammi by way of Howard Chu. Here's the arc listing (are the zoo-ized versions more recent?):

```

I have some questions (again....yeah I know it's getting old)
about various things. Your help would be greatly appreciated.
1) I need to get a telecommunications software package for my
mega2. I want something that will do terminal emulation,
file transfer, maybe automatic dialing etc. I keep hearing
about a program called Flash. Is this program any good
or would you recommend something else ?

2) I have a mega2 st that I just got a few weeks ago. I also ahve
Mark Williams C. Is there a way to find out what version of
Tos is in my Mega ?

3) I have been trying to learn about programming GEM applications.
I have the MWC documentation and the Balma Fittler book on GEM.
I have a little experience with C (I'm learning) and I've never
written any software using any windowing system.
I'm confused.....I have a program that hopefully will display
a window on the screen. I have been able to get the window to
appear and look for me to hit the 'close' box. I notice that
I have to apparently trap the cursor movement to the sliders,
bar at the top(to move the window), or the shrinkbox thingy.
I have my program setup using evnt_mesag() to wait for these
but I don't know what to do when I get one of them.
I see all sorts of stuff in the books from wind_x functions,
to graf_x functions to vdi_x functions. I can't figure out
when to use what.
Is there a book that will tell me step by step what needs to
be done to write a very simple GEM application?
4) What is the relationship between a window and a workstation in
GEM ?

5) How do you make a GEM program display data in one (or more) of
the windows/workstations you've created ?

thanks,
keith

(see I told you I was confused....! :-))

2209. TOS, Zoo, or Zen?

Newsgroup: comp.sys.atari.st
Date: 1989-10-30 14:30:36 UTC
From: achowe@tiger.waterloo.edu
Message-ID: <17655@watdragon.waterloo.edu>
Source record: 247680

Well I still not sure who is at fault: zoo, tos 1.4, or me?

I have tried the following test with two different versions of
of zoo (2.01STe - 89.5.31 and 2.01STg - 89.3.30). The way I generate
the problem is:

(under TOS 1.4 - 89.4.6)
zoo -backup snert snert*
zoo -test snert
(CRC failures left, right, and centre)
(switch to developer release of TOS 1.4 - 88.8.8)
zoo -backup foo snert*
zoo -test foo
(alls well)
zoo -test snert
(still faulty)
(switch back to TOS 1.4 - 89.4.6)
zoo -test foo
(works fine)

So the problem is that both versions of zoo will not generate sound
archives under TOS 1.4 - 89.4.6 for some reason. Yet under the developer
release of TOS 1.4 - 88.8.8 everything is hunky-dorey.

My machine environment is a colour Mega 2 with a Megafile 60. I'm using
tos14fix, maccl2, quickst.acc (1.5), emulator.acc, control.acc, and
memfil20.acc. Now Ron Jeppesen claims that zoo - 2.01STe works on his
machine under TOS 1.4 in ROM. What is difference here? Why me and not
him? Please no Zen answers.

Comments from Atari, Daan Josephus (zoo ST) Jitta, or others are most
welcome. I want to narrow down this problem one of three things,
zoo, tos, or my environment. Now I currently believe tos is the cause
since my environment and zoo have not changed in months.

2210. Mouse vs keyboard

Newsgroup: comp.sys.atari.st
Date: 1989-10-30 14:34:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19891030143436.0.JRD@MOA.SCRC.Symbolics.COM>
Source record: 247613

I've been hacking on a tty interface that mixes encoded mouse events with regular keyboard input, and have run across some peculiar behaviour. I have mouse motion and button handlers, installed with the usual VDI routines, which work fine by themselves. However, when I tried letting the application hang in Bconin, and hit a mouse button, everything wedges up; no keyboard, no mouse, nada. Changing things around such that the keyboard stuff sits looping until Bconstat says there's input pending causes it to work sometimes, but occasionally it still wedges up as above.

It seems like when my mouse routines routines preempt Bcon<foo>, things go downhill in a big hurry. Has anyone ever seen behaviour like this? Is there any reason why this kind of scheme shouldn't work?

On a related topic, does anyone know of a way to provide a handler function for keypresses, similar to the mouse-motion and button handlers you can set with VDI? Ideally, I'd like to trap all keyboard events, ie key-up, key-down etc. I'd settle for encoded key events, like what you get back from Bconin. Hints anyone?

> ...

Checking to see what software on a computing platform is certainly a good idea. On the other had, if you buy a machine when it first comes out, you really don't have the luxury of examining a broad software base. It's too bad that the process of hardware introduction - software availability is akin to the "chicken before the egg" situation. One can't always tell how a machine will do in a marketplace, thus restricting the amount of software inititially developed for the machine. This lag in software availability translates to diminished hardware sales - after all, there are machines out there that can do the same thing at roughly the same prices. What makes a difference in the early moments of a computer's life-cycle is support from the manufacturer. The fact that Atari has not always provided good aftermarket support has not helped it in the marketplace.

When the ST was first introduced, it was a good, low cost computer with the same capabilities as other machines on the market (the Mac, the AT). The Mac market and the PC compatible market have moved forward in the last few years. We are now only getting a glimpse of what Atari has to offer for the future. In many ways, the TT is a good machine. Is it significantly better than what a decent 386 clone has to offer? I don't think so. Unless Atari gives users an overriding reason to buy a TT, it's market penetration will be marginal, at best.

In short, Atari will have to offer more than "power without the price" to lure people to buy their machines. I'd be interested to see how the new machines are marketed (with Comdex coming soon). And in keeping with today's consumer spending attitude, "give me a reason to buy it, and I probably will." Good software (that I can use) is as good a reason as any.

2215. bug in GCC floating point lib

Newsgroup: comp.sys.atari.st
Date: 1989-10-30 16:06:44 UTC
From: piet@cs.ruu.nl
Message-ID: <1749@ruuinf.cs.ruu.nl>
Source record: 247685

I discovered a bug in the double precision floating point lib by Scott McCauley/John Dunning (dflonum.c). The routine to convert doubles to floating had a long where an unsigned long was required, thus causing a right shift to do a sign extend. This gives a few bit errors in some conversions. There was also a superfluous satement. Here is a patch:

```
*** dflonum.c.~1~ Thu Jul 13 12:27:25 1989
--- dflonum.c Fri Oct 27 09:52:42 1989

2216. Re: GEMQ Startup code (Please Send)

Newsgroup: comp.sys.atari.st
Date: 1989-10-30 16:11:46 UTC
From: steve@thelake.UUCP
Message-ID: <0930891011469789@thelake.UUCP>
Source record: 247686

In article ,
glk01126@uxa.cso.uiuc.edu writes ...

> Could someone out there send me the GEMQ libs for sozobon?
> With the startup code... (I can't get it to find int_in etc.)
> Thanks in advance...
> -Spieu!

****Please note that int_in and intin are not the same thing.****

The startup code is the first module in the AESQ.A library archive (which I sent you the other day), entitled "header.o." It defines the following globals:

```
_aespb 18 global external abs
_vdipb 14 global external abs
_control a global external abs
_global 20 global external abs
_int_in 22 global external abs
_int_out 10 global external abs
_addr_in c global external abs
_addr_ou 8 global external abs
_gl_apid 2 global external abs
_Ix2 0 global text
_appl_in 10 global text
_aes 7e global text
_appl_ex d0 global text
```

(Note the leading underscore. This is conventionally used to distinguish C objects from asm objects. The underscore is automatically prepended by the Sozobon hcc code generator. In C sources, _int_in would appear as int_in.)

If your GEM program calls appl_init() (which it must), this module will be linked with your program whenever you "cc -o prog.prg prog.c aesq.a".

int_in[22] and its relatives are "mailboxes" used by the AES. As you see above, they are defined in the library.

intin[128] and its relatives are "mailboxes" used by the VDI, which is required because the AES user-interface stuff uses VDI. For some reason, they are *not* commonly defined in libraries, even though they *always* are needed by GEM programs. Instead, the convention is to include the following declaration in one of your C source files:

```
/* GEM-VDI arrays */
int work_in[11], work_out[57],
contrl[12],intin[128],ptsin[128],intout[128],ptsout[128];
```

Ian Lepore's GEMFAST bindings do not use these arrays; instead, the
mailboxes are created as auto variables (using stack space) on the fly.
Therefore this declaration will be redundant in a program linked to
GEMFAST, and often is omitted. The omission causes portability problems.
If you are compiling such a program, the Sozobon linker will holler at you.

If it indeed is "_int_in" and not "_intin" that the Sozobon linker is
complaining about, contact me via mail (uiucuxc!pwcs!thelake!steve) and
I'll try to figure out what the heck is going on.

Incidentally, I exchanged mail with Ian Lepore the other day. He said
GEMFAST 1.3 has been in beta test for several weeks with no bug reports,
so he expects to release it Real Soon Now.

>>Mips.
>
>Somehow I doubt the Cray uses an 8 MHz 68000 for file IO ....
>
```

These claims are very misleading in that they imply that a system with 13 transputers will actually run a program 1/5th as fast as a Cray (I'm assuming the above MIPS figures are correct.) _Each_ T800 has a processing power of 10 MIPS (the upper limit at which instructions can be processed.) So if you have a calculation-intensive application, say one that does ray-tracing, you can expect that peek to be reached. If you ran this same program on a 13-transputer based ATW, I doubt whether you will see significant increases in performance, since that application will be run on a single T800 (unless it was specifically written with parallelism in mind - using OCCAM(I guess that is the T800 assembly language?) - I don't think there are compilers smart enough to take conventional C programs and parallelize them.)

I am not familiar as to how applications have to be written to run on a CRAY, but my guess is that you can use conventional C programming. So if you took the above program, recompiled and ran it on a CRAY, you _would_ see significant speed improvements (if 100MIPS = 1/5 Cray, I guess the program would run at 500 MIPS?)

In any event, benchmarks of the above type are useless unless they are placed in the right context. Yes, some programs run just as quickly on an Apple II as on a CRAY, given enough restrictions on what the program does.

From: royg@cadovax.UUCP
Message-ID: <2456@cadovax.UUCP>
Source record: 247689

"TT/P" was referred to as "Plastic" during my days at Atari, to differentiate it from the larger, metal, versions.

"TT/P" should now be considered, at least in these circles, to refer to the "Personal" version of "TT" (ie desktop), as distinct from the larger version which is more business/multi-user oriented.

> I would hope that Atari can release their version of Unix for the TT within
> a reasonable time period of the computer's release (unlike Commodore, which
> has promised Unix on the Amiga for years now).

That's certainly an exaggeration. First of all, Commodore's only had machines capable of running UNIX out for not quite a year now (the A2500/A2620), and they never claimed that UNIX would ship as soon as the hardware was available to run it. If you're going to commit to porting UNIX to you're machine, you have to to right, and do it right the first time. Hopefully Atari will think similarly if/when they do a port for their '030 machine. You're dealing with a different set of customers with UNIX than with the native environment. In part, you have much less of a distinction to offer, and you're far more likely to offer something distinctively bad than distinctively good. If you ship a faulty, incomplete, or hastily ported UNIX the first time, you may not have anyone listening by the time you get around to fixing it -- you've already built a bad reputation. I'm glad Commodore had enough sense to realize it has to be done right the first time around.

> developer's hands for a while.

They did in fact announce a 2500UX at the same time the 2500 was introduced. That was at the '87 CeBit fair in Hannover, West Germany, and the first real showing of UNIX on an Amiga, though that was an older version, and the A2500 hardware at that point was still beta hardware. The A2500 itself actually started shipping around a year ago, I don't recall if it was November or December. UNIX has been in beta test at various sites for at least that long.

> I think the major delay is inthe fact that CBM decided to change the hardware to
> a 2000 with a 25MHz 030 board, and there was a lot of retesting & redesigning to do.

The '030 board work was actually started long before the A2500 actually shipped at all; it was kind of a logical outgrowth of the A2620 board that powers the A2500 (the first one was shown to developers at the Amiga DevCon in April of '88). How they configure an A2500UX is pretty much up to the folks responsible for integrating the system -- they have the choice of CPU (14.2MHz '020 or 25MHz '030), hard disk, whatever. Naturally the folks who are given the choice prefer the '030 system, but the bundle ultimately sold by Commodore comes down to a marketing decision more than anything. They have to take into account the price, competition, etc. as well as SPEED, which of course is what REALLY matters.

2224. GDOS and AMC GDOS

Newsgroup: comp.sys.atari.st
Date: 1989-10-30 20:23:34 UTC
From: JJL101@PSUVM.BITNET
Message-ID: <89303.152334JJL101@PSUVM.BITNET>
Source record: 247693

Hmmm...could someone out there enlighten me as to the differences between
GDOS and AMC GDOS.....also, where can I get info regarding the content
of the assign.sys file, and perhaps an overall tutorial of GDOS in general?

Thanks in advance,

2225. Re: Malloc(-1L), free memory...

Newsgroup: comp.sys.atari.st
Date: 1989-10-30 20:37:35 UTC
From: apratt@atari.UUCP
Message-ID: <1754@atari.UUCP>
Source record: 247694

Well, in a large-memory machine, there can be a LOT of 4K blocks
around. This makes for a lot of recursion.

Re-think this problem as a loop. Use the first long of each block as a
link to the previous block. Keep Malloc'ing until you run out, then
free up the list. Like this:

```
long freemem()
{
long size, total;
long *start;
long *prev = 0;

do {
size = Malloc(-1L);
if (size) {
total += size;
start = Malloc(size);
if (size < sizeof(char *)) {
/* end of map: too small to keep track */
Mfree(start);
break;
}
*start = (long)prev;
prev = start;
}
} while (size);

while (prev) {
start = *prev;
Mfree(prev);
prev = start;
}
}
```

I have a friend in Junior High that wants to get a computer, but doesn't know what to get. I believe that he wants to spend <$1000, so I suggested that he look into Atari STs. I've looked over all the previous postings available on my system, but still have a few questions... If you have experience with emulator packages (emulating Macs or IBMs), please drop me a line or two regarding performanec and limitations... Also if you have any comments in general on the IBM clone vs. Atari decision, feel free to drop me a line, as well.

Please reply by email to the bottom address of my signature as reply may or may not work depending on your news reader... I will summarize and followup at a later date...

Thanks,
Ron

Source record: 247614

Once again I must apologise to anyone who has attempted to logon to the BBS that I announced two weeks ago. I have since discovered that the BBS program I am using does not like my Supramodem 2400.

I have been in contact with the author of this program, and he has informed me that the problem has now been fixed. When I receive a copy of the fixed version, I shall resume operation of the BBS. The target-date for resumption is mid-November. At that time I shall post another message informing intereste
d
<oops> interested parties that the BBS is up.

On a brighter note, there should be many more files available at that time, as I am adding several each day.

For those who are wondering just what I am blithering about, I am attempting to set up a part-time BBS to carry all of the files, past and present, from the comp.binaries.atari.st newsgroup. The purpose of this BBS is to allow people who do not have access to the net the ability to get a hold of the files.

Once again, my apologies for the delay.

2230. redirect printout to disk

Newsgroup: comp.sys.atari.st
Date: 1989-10-31 00:09:14 UTC
From: ron@argus.UUCP
Message-ID: <1330@argus.UUCP>
Source record: 247698

I need a TSR or Desk Accessory which redirects output intended for the printer to a disk file. Some programs (like WordPerfect) have this capability built in, but I need 'print-to-disk' for Easy Draw.

Perhaps I could modify a print spooler to do this - is source available for any spoolers?

Thanks!

2231. Weird Spectre GCR problem

Newsgroup: comp.sys.atari.st
Date: 1989-10-31 00:18:19 UTC
From: rob@hhb.UUCP
Message-ID: <288@hhb.UUCP>
Source record: 247699

[This space intentionally not blank.]

I, too, have finally received my GCR!
However, I have encountered a weird problem.
Has this happened to anyone; can anyone suggest a fix?

I bought Zork Zero for the Mac - 512K RAM required, DS disk.
Tried it on a real Mac - no problems - starts right up.
When I plug it into my Atari, the GCR successfully reads it and opens a
window displaying the file icons - an executable, the usual story.dat, and
two other files: Pic.data and Cpic.data (This Infocom game has some graphics!).

BUT when I double click on the program, it gets as far as displaying an
empty Zork Zero window and a menu bar, then the disk gronks for awhile,
then the Mac desktop re-appears! No error message from either Mac or Spectre!

What is going on?

The disk is NOT copy protected, and I can copy all its files on a real Mac.
However, when I try to copy the files under Spectre, I am told that the
pic.data files cannot be read. Why are the other files readable but those not?

I saw a compatibility list that included Zork Zero. What am I doing wrong?

Here's the setup:

I have a 520 upgraded to 1Mb, with a Diverse Data Products MFD 1440 paired
DS drive unit - I ran speed.prg - both A: and B: check out to 300 RPM exactly.
I have pre-1.4 TOS on ROM. Atari mono monitor. 128K Mac ROMS. GCR last in chain.
I am running Spectre 2.3 with the factory settings: 832K, no cache, alt video,
no sound. I have tried booting Mac mode with 5.4/3.2 and 6.0/4.2, and I have
turned sound off from the control panel before starting Zork Zero.
No HD20, No MacBeep, No ramdisk, no nothing.

Note: I ALSO had the same problem trying to create a magic disk using the
Translator One under Spectre 128 - it told me the picture data files couldn't
be read.

I would appreciate any help. Thanks in advance.

2232. GCR software compatibility

Newsgroup: comp.sys.atari.st
Date: 1989-10-31 00:20:08 UTC
From: rob@hhb.UUCP
Message-ID: <289@hhb.UUCP>
Source record: 247700

[This space intentionally not blank.]

Here is another GCR compatibility report. Dave, are you out there?

The game Corruption (Mac disk) causes an "Illegal Instruction Error" when run.
(It's aptly named.)

The Spectre crash page looks like this:

SR = 00002200 PC = 00000020
Last LineA PC: 0000E020 Last LineA Trap: 0000A746 Last Line A0: 000E0806
USP= 000392AA SSP= 000C7762 SR (T.S., .IPL, ...X, NZVC) = 00002200

R 0 1 2 3 4 5 6 7
D 0000FFFF 00000000 FFFF0000 000001FC 000001FC 0000FFFF 53545253 00000000
A 00000010 00000000 000EF6D8 0000CC1C 0000D054 000C7D60 000C798C 000C7762

I don't know if it's copy protected; it may very well be. Is this program
already on a (non-)compatibility list?

Here's my setup:

I have a 520 upgraded to 1Mb, with a Diverse Data Products MFD 1440 paired
DS drive unit - I ran speed.prg - both A: and B: check out to 300 RPM exactly.
I have pre-1.4 TOS on ROM. Atari mono monitor. 128K Mac ROMS. GCR last in chain.
I am running Spectre 2.3 with the factory settings: 832K, no cache, alt video,
no sound. I have tried booting Mac mode with 5.4/3.2 and 6.0/4.2, and I have
turned sound off from the control panel before starting the program.
No HD20, No MacBeep, No ramdisk, no nothing.

From: stephen@oahu.cs.ucla.edu
Message-ID: <28655@shemp.CS.UCLA.EDU>
Source record: 247601

In article <5188@cbnewsh.ATT.COM> wolf@cbnewsh.ATT.COM (thomas.wolf,ho,) writes:
[performance numbers deleted]
~
~These claims are very misleading in that they imply that a system with 13
~transputers will actually run a program 1/5th as fast as a Cray (I'm assuming
~the above MIPS figures are correct.) _Each_ T800 has a processing power
~of 10 MIPS (the upper limit at which instructions can be processed.) So
~if you have a calculation-intensive application, say one that does ray-tracing,
~you can expect that peek to be reached. If you ran this same program on
~a 13-transputer based ATW, I doubt whether you will see significant increases
~in performance, since that application will be run on a single T800 (unless
~it was specifically written with parallelism in mind

This is somewhat true. Although Crays perform well on scalar code, their real
speed is only evident on vectorizable problems. As on the Transputer,
applications must be specifically engineered to perform well. It is true
that there are Fortran compilers which are _very_ good at vectorizing code,
and C compilers which can do the same are starting to appear, but since C
isn't deisgned for vectors, it's not as easy to do.

~ - using OCCAM(I guess that
~is the T800 assembly language?) - I don't think there are compilers smart
~enough to take conventional C programs and parallelize them.)

Occam is a high level language, but it is designed to be simple. The name
comes from Occam's razor which was said to be able to separate what was
necessary from what was unnecessary. Occam has constructs for making
parallelization easy so it can use as many processors as are available.
The application you mentioned (ray-tracing) happens to be an extremely easily
parallelizable problem (I've done it on a four processor SGI Iris) so it
might very well reach the peak performance of the T800s.

~I am not familiar as to how applications have to be written to run on a CRAY,
~but my guess is that you can use conventional C programming. So if you took
~the above program, recompiled and ran it on a CRAY, you _would_ see significant
~speed improvements (if 100MIPS = 1/5 Cray, I guess the program would run
~at 500 MIPS?)
~

And again, if you compiled said application with a parallelizing compiler,
you would see vast improvement on a 13 processor transputer system.
It's true that communication overhead will detract from the transputer
performance and not the Cray. Take a look at CMU's iWarp processor. It's
a good example of a machine designed to be good on its own and _better_
when networked. The link speeds make the transputer look like a 6502.

For Sale:

Atari 1040 STf computer:
1 M RAM
800K double sided internal 3 1/2" drive
Mouse
Atari SM-124 monochrome monitor
Atari 1200 Baud Hayes Compatible Modem
Practical Solutions Monitor Switch
WICO Trackball
WICO Joystick

Software:
MaxPak (desktop utilities: spooler, RAMdisk,
keyboard macros, etc.)
Publishing Partner (desktop publishing software)
Word Writer ST (professional quality word processor)
Data Manager ST (file management system)
SwiftCalc ST (spreadsheet system)

[Word Writer, Data Manager, and SwiftCalc
are all interoperable]

PC-Ditto IBM-PC compatibility software
FLASH terminal program
First Word

Games and Entertainment: (requires color)
Dungeon Master
Airball Construction Set
Music Construction Set
Leisure Suit Larry

STart disks for the last two years
and lots of neat PD stuff.

Optionally:
Magnavox SM-40 color monitor (accepts NTSC from
your VCR, CGA/EGA output from your PC clone)

Message-ID: <QZHCiQG00VoH46k15p@andrew.cmu.edu>
Source record: 247604

I've had this problem for a short while, but I thought
all ST's did this. I have a 1040 STf from about 2 years
ago, when I switch disks it doesn't handle it correctly
suppose, my disk has 400k free and I loaded a 40K file
into memory from one disk, then put my 400k disk in the
drive and saved. The 400K disk now says 360k free, but
shows no file!. I talked to another st'er about this
told me to check if there was a "c" on the bottom of
my computer- there is. He said my problem was that about
2 years ago, Atari put a different drive in the ST's
and marked them with a c. This is making my life keck!
Is thare anything I can do, shouldn't ateri replace it,
and should they charge me?
Thanks,
zl04+@andrew.cmu.edu

> works as it should.
>

The desktop has 32 internal buffer slots and these slots are shared
by disk icons and application definitions ( #F, #G, #P ) in the desktop.inf
file.
If you use up all the slots for icons, the desktop will have no
room to install the application definitions. In this case, the desktop
can only treat all the files as text files. It is not a bug, it is the
limitation of the desktop.

>so much software (even some DEC things, not just 3rd party stuff) that it
>was impossible to use for an awful long time where I work.

It's not the fact that software "broke" with the release of TOS 1.4 that
I was referring to... in fact, I fully agree with Atari on this point. If
software breaks the rules, then it's vulnerable to being broken.

I was referring to the feeling of "get in there with a soldering iron and
fix it yourself" that is endemic in the Atari world. Hack in a memory
upgrade because Atari doesn't offer one. Rip out your CPU to kludge in
a faster processor, since Atari hasn't offered anything in 5 years. Tear
out your Shifter chip to add colors to bring your system up to the level
that other manufacturers now sell.

How many DEC VAX customers are going to go out and "burn a XXXXX EPROM
instead of two XXXXX Eproms and switch between the $0000 and $FFFF
address areas"..? When was the last time your VAX had to have chips
piggybacked or held in place by double-sided "sticky tape"..?

Atari makes a lot of noise about becoming a real presence in the business
world, but falls far short of the kind of performance that business is
going to require.

Hi there. I am slightly interested in what exactly is in the airwaves out there, but don't wanna spend a bundle, so I was wondering if there is anyone out there that knows if there is an interface so that I can hook up my simple shortwave radio via Headphone output, or RCA plug, up to my 1040ST, and run special software so that when I tune in a station with MORSE CODE being broadcasted, the translation will come up on the screen. sounds simple? I think so, but don't know where to start. If anyone can help, I'd appreciate it.

Replying to my message, Jouni Alkio says:
>People still buy ST's and MAC's, they are much the same technology

True, except that in the same time period Apple has improved their product by expanding it, speeding it up, adding expansion capabilities and giving it far improved sound and graphics... Atari has not.

>Do you think introducing a PC-pocket clone is playing. Many people
>really want to buy one. Do you mean that Atari should only introduce
>computers - not video games?

Not at all... they can of course make whatever they want, whatever makes them money. My objection is that they've neglected their computer market and owners of their computers by going out after the "gadgets" market. A PC-pocket clone does not benefit ST owners at all. (No arguments about the influx of R&D or advertising money please.. Atari Corp has already demonstrated that to be false).

>Do refer to the TT as nonstandard?
>Is UNIX not a standard?!?! What about all the ST programs there are??

Yes, the TT is non-standard. While it has a VME card slot, the rest of the system is non-standard. Atari Corp would have to obtain a VERY large market share before it could be considered a "standard".. this is not going to happen. UNIX _is_ a standard, but Atari has already announced that UNIX will _not_ be shipped with the first TTs. With their track record of "followup", I would not call a promise of UNIX a "standard".

ST programs are by definition "non-standard" because they run on the "non-standard" ST (in the same way Amiga is "non-standard" and now CP/M and Apple II have become).

>Haven't you heard of the Stacy and the ATW? They are not video games.

Yes, I've "heard" of them. I've also "heard" of the Octobussy, the Moses PromisedLAN, the CD-ROM drive, the Atari hardware IBM emulator board and the AMY chip.

Even if the STacey ever makes it to the marketplace, it is only a portable version of a "non-standard" computer. They'll probably only sell to owners of STs and small niche markets like performing musicians. If Atari would develop the ST market so that it *WAS* a "standard", then they'd be able to sell a portable version of it.

The ATW is not a video game, but it's not something that's likely to benefit you or me. Development of the Atari ST computer line _would_

>> Will your company's President approve a purchase order for "Atari Computer
>> because they make the "third rate" video games in the world..?

>I certainly would not work for a company that has such a President! I
>don't really like prejudiced people.

It's not a matter of "prejudice", it's a matter of track record, credibility
expertise and trust. Atari Corp has NONE of those. A company would be
foolish to risk their financial wellbeing on using Atari computers.
Computer companies like IBM and Apple have _demonstrated_ their ability to
deliver and support their products. Atari Corp has not.

Source record: 247608

In <10087@stag.math.lsa.umich.edu> hyc@math.lsa.umich.edu (Howard Chu) writes:
>Just for my own curiosity, I downloaded the QuickST 1.6 demo and
>checked its speed with QuickIndex 1.5.

Howard, the Quick ST 1.6 demo was not intended to be Quick Indexed. It is slower than the actual release version of Quick ST 1.6, and so the numbers are misleading. The purpose of the demo was to satisfy all the people who said they'd register if the Quick ST 1.4 wasn't so buggy. Well, it's no longer buggy, so I should be seeing a few more shareware donations, right? <grin>

The demo is still faster than all previous versions of Quick ST and that other program, other than version 1.6 of the other program. The release version is a tossup, because it is faster than that other program in some cases, and slower in others. On average, pretty even, and half the size of that other program. Quick ST even does pretty well with that SPEEDTST program they provide with that other program. I do not mention the name of that other program cuz it is overpriced and its advertizing is misleading, and it doesn't need any more free publicity.
...
long list of benchmarks omitted.
...
>Dunno why column A doesn't just say "100" all the way down the line.

You must have had some other TSR or desk accessory installed, like GDOS or Hotwire. Any program that hooks the TRAP vectors will reduce the speed.
...
>Kind of interesting... Makes ya wonder how you could put up with
>text operations on an ST just out of the box. Things really do look
>real real slow, until you use one of these add-ons. Pretty hard to
>judge which one to use, though.
>
The blitter is inefficient at plotting text. There is too much setup work to do to plot even a single character.

>I'm kinda bummed, myself. Neither of these two programs work with
>non-standard screen sizes, so my Overscan switch is idling in the
>normal position.
>
Quick ST automatically supported Hyperscreen up to version 1.5. Since I only knew of two other Hyperscreen users here in North America, I did not include it in the demo. I was in contact with the author of overscan, and I suggested that the best place to put Quick ST support for Hyperscreen would be in Overscan itself, since both programs run from the AUTO folder, and so could be merged. Since Quick ST source code was posted, as well as Overscan source code, I'm sure some industrious person out there will merge it sooner or later.

Quick ST can still support custom screen resolutions, since the code is resolution independent. All I need is your desired screen resolution and your shareware check <grin> and you'll have a Hyperscreen version.

Since you're on usenet, custom versions can be sent out same day. We don't force you to mail in a disk and $5 every time there's a new file like with that other program.

>I s'pose I wanna comment on the numbers themselves, since I've
>gone to all the trouble of typing them in. Interesting to note
>that the BIOS text operations (Bconout, Cconws) done by both
>programs completely ignore the blitter.

Already explained.
...
>TurboST gains a few percent in scrolling when the blitter is
>active, but QuickST ignores it there as well. (Interesting, but
>not a very significant difference, to be sure.) Also odd how the
>different resolutions alter the speedups. Like, in monochrome,
>the blitter accelerates GEM draws by 35% all by itself. But, it
>only speeds up both TurboST and QuickST by about 20%. Then, in
>medium, the blitter accounts for only 30% by itself, but speeds
>up both TurboST and QuickST by about 40%. Funky Stuff there...

Quick ST doesn't use the blitter for scrolling. If you can tell the difference with and without a blitter, you should be a baseball umpire or something. Quick ST owes its small size partly due to the fact that it doesn't waste code trying to optimize something to gain an extra 1% or 2% in speed.

The down side is that Quick ST will score lower on benchmarks. But it is silly to worry about a few percentage points. Your eye will not notice the difference, and so why why waste code on minor optmizations.

For example, say your car is badly tuned, and the tires are a bit flat. You take the car into Quick Mechanics and have it tuned. Suddenly it's a lot faster and fuel efficient. You notice that. Then you add some air to your tires (which Turbo Mechanics charge you $50 to do). You probably won't notice a difference until you actually measure your exact milage, and then it'll be something small. You see the point I'm making.

...
>Hm. Does anyone else out there really care about this stuff?
>I'm pretty curious to see some numbers for the various hardware
>accelerators now...

Hardware accelerator results were compiled by a few different people a few months ago. From the results I saw, and from my own benchmarking, the Turbo 16 board by Jim Allen is by far the best accelerator. And you don't need Quick Index to see it. The other accelerators, like CMI, JRI, Datafree, etc, aren't worth the paper they're advertized on, unless you're into spending $100 - $300 for a 10%-20% speed increase in most programs. The Jim Allen board will give you about 50%-60%, possibly more during number crunching. Definately a good buy. No, he didn't pay me to say this. I saw his board and tried it and it's great.

Like I mentioned, Quick ST source code is available on Genie and Compuserve
and was probably somewhere on here a few months ago. If you have any questions
about it, either look at the source code or ask me or Ignac. You don't need
to guess.

2244. Prospero Address in US

Newsgroup: comp.sys.atari.st
Date: 1989-10-31 08:02:49 UTC
From: schiers@imdm.uke.uni-hamburg.dbp.DE
Message-ID: <290
Source record: 247612

Hi there,

here is the address of Prospero in US for all, who
don't want the extremly fast way of compilation, but
a compiler, which works on the full standard, has
no restrictions on array-sizes etc., where you get
the first update free, get some more free if you find
a bug, where you are able to link Assembler, Pascal,
ANSI-C, and FORTRAN together and debug them with the
source-code debugger, ...

Well, I agree that medical 3d image processing is a very
special problem, but tell me why a st-compiler should have
any restrictions like 32K? It's a 68000, not this 4040
compatible 64K+64K processor. Well but now the address:

Prospero Software Inc.
100 Commercial Street,
Suite 306,
Portland,
ME 04101,
U.S.A.

And remember, I don't know them, I only know the software
and the excelent german distributor.

Carsten.

2245. LOGO? LOGO!

Newsgroup: comp.sys.atari.st
Date: 1989-10-31 08:05:26 UTC
From: HAHN_K@DMRHRZ11.BITNET
Message-ID: <8910310805.AA27364@ucbvax.Berkeley.EDU>
Source record: 247616

I'm desperately trying to find a DECENT and moderately FAST
LOGO for the ST (I even consider buying one for the IBM AT, iff
you can provide any pointer ...).
Is someone out there who knows about a LOGO implementation for the
ST that he/she would recommend without fingers crossed?

Any hints heartfully appreciated,
Klaus.

2246. PC-emulators

Newsgroup: comp.sys.atari.st
Date: 1989-10-31 08:14:36 UTC
From: jackin@utacs.UTA.FI
Message-ID: <771@utacs.UTA.FI>
Source record: 247622

In ST-Magazin 11/89 were two PC-emulators compared :
PC-SPEED and SUPERCHARGER.

****

SuperCharger

- NEC V-30 at 8 Mhz
- 512 Kbyte ram (max. 1024 Kb)
- socket for 8087
- CGA-emulation (only this, no herc.)
- MS-DOS 4.01 included (on two 3.5`` disks)
- supports ST-mouse fully
- supports also SLM 804 !
- '' harddisks (AHDI-compatib.)
- connects to DMA (external housing, size of an Atari 3.5'' Drive)
- two DMA-ports (one for ST, the other for HD, SLM etc.)
- reset switch (on the front of the housing)
- you can flip between ST/PC via hotkey
- Norton SI 4.2
- price 798 DM (about 435 USD)

Beta Systems Computer AG
Stauenfenstrasse 42
6000 Frankfurt
West-Germany
(tel. 069/1700040)

Reviewers found out that SuperCharger is very compatible. Among tested
programs were dbase 3 +, Flight Simulator 3, all Larrys, 1-2-3, MS-windows,
Norton Utilities 4.0,Turbo-Basic, -Pascal 3.0 & 4.0, -C 1.0, Psion Chess.
All except two games (ChessMaster 2000 and some other) worked.

PC-SPEED

- NEC V-30 at 8 Mhz
- uses ST-ram (1 Meg ST ;704 Kb free ram + 64 Kb EMS)
- no socket for 8087
- CGA, Herc, Olivetti - emulation (with Hyperscreen FULL Herc-screen)
- no MS-DOS included
- supports harddisks (AHDI, ICD - compatib.)
- goes inside ST
- Norton SI 4.0
- price 598 DM (about 326 USD)

Sack Electronic
Bleichstrasse 49
4792 Bad Lippspringe
West-Germany
(tel. 05252/4290)

PC-SPEED runs about the same programs as SuperCharger (MS-windows failed). It has more trouble with protected programs (mostly games) because it's floppydisk-driver isn't as good as SpeedCharger's. Mouse support ain't that good either. But Graphics emulation is better. No idea how much free ram with 2 Meg, propably no more than with 1 Meg (they didn't say).

****

Thought you might be interested.

These are availiable in West-Germany now. By the way why don't you folks in USA get ST-stuff from Europe. There is various ways to achieve this (mail is one :-). After all I usually buy my stuff from the USA (and England and Germany).

2247. TOS 1.4 Incompatibility

Newsgroup: comp.sys.atari.st
Date: 1989-10-31 09:56:01 UTC
From: neil@cs.hw.ac.uk
Message-ID: <3629@brahma.cs.hw.ac.uk>
Source record: 247609

In light of the recent discussion on software incompatibilities that people seem to find now that they have got TOS 1.4 here is my tuppence worth.

I am 99% certain that most cases of incompatibility are due to the software house and not Atari's ROMs.

Some software developers always think that they know best and take an anything goes attitude.

When TOS 1.2 came out loads of things broke:-

* Arkanoid & Publishing Partner couldn't read the mouse any more because they were using an illegal method for reading it.
(A fixed version of Arkanoid was later shipped by Atari UK in a games pack)

* Super Sprint's protection wouldn't work because they relied on a bug in the disk handling.

* Many games software loaded at absolute addresses but still needed TOS calls. They broke because TOS 1.2 used more RAM and the games sat on that RAM. FS2 from Sublogic did this but I believe that they've fixed it now.

* Some games software insisted on setting their screen RAM to absolute address $78000. When TOS 1.2 took more RAM the loaded executable banged its head on its own screen RAM.
(I believe this still goes on)

I heard people saying that the new ROM's were crap, even dealers who should have known better. Have you ever had to explain the underscore bug to a student who just lost his big text file?

Now we have TOS 1.4 and a new set of incompatibities have sprung up. Most games these days are probably using encrypted executables which to TOS bear no resemblance to what will actually be run. I badmouthed packing executables earlier this year for the same reason. We now have the fast loading bit in the header. Who knows what future uses the other bits may have.

PC and Mac Emulators have had some compatibility rumours too. Would someone care to explain to to me how TOS 1.4 which is in 68000 could have any effect or even be needed by a PC emulator that tells TOS to 'shut the **** up'. Emulators want the inbuilt hardware not the software. With the exception of the loading/startup software emulators DON'T USE TOS!

The STE has its ROM loctated at a different address. Perhaps protected games are checking that all the vectors are in ROM before running. If they

assume that the ROM starts at FC0000 then they will break. There are official methods for this too.

Ken Baderstcher said that some bugs were left in the TOS 1.4 for compatibility reasons (most notably the 2K wasted disk space and Malloc handling). But he also said that they were no longer committed to future compatibilty on these issues and that we should play by the rules or suffer the consequences.

The speed of the TT means that lots of software will really fly! I would just love to see all those game get all their work done in under a frame but if they fool about we never will. The TT I hear has two kind of RAM and TOS may have the say in where and which RAM your program is loaded. If people insist on absolute location of programs then there will be havoc.

OK I know I'm gonna get flamed rotten for all the above.
Atari should probably have said most of it themselves. My favourite program, Gulam, is going to have problems with TOS 1.4 too. Again I still don't blame Atari. (Go an Allan post yours)

Most uninformed crap I ever heard award:-
"New TOS? Yeah I know all about it! It gonna be version 2.00, will be written by Dave Staugas and Atari UK are the people working on it!"
This stupid statement was based on the fact that Dave worked on some of the ROM and that he put some messages in it.
No offence meant to you Dave. I *love* Neochrome and hope you are working on a version that uses the power of the TT.

`
`1. Can the GNU C complier use dlib and gemfast bindings for writing
`TOS and GEM programs?
`

Not without change. Dlibs and Gemfast have been written for a 16 bit compiler. I have a version of Dlibs that I adapted for use with GCC. It has been modified for 32 bit integers. I also found and corrected quite a number of bugs. I did not like everything from Dlibs, so I changed a few things to be more Unix-like, and I replaced a few modules with stuff from other sources. The library as it stand now is very useful. I found a few bugs in the last weeks while porting ``perl''. I have reported most bugs to Dale Schumacher (except the batch from last week).

As for gemfast, somebody did a port of a previous version to GCC, but that seems to be very buggy. There was also a gccgem library on the net, but I haven't tried that yet.

Source record: 247618

Anyone remember the discussion here a while ago about For Sale notices? And how it seemed a bit silly to send details of equipment available only to those in limited geographical areas all round the world, using up network time and giving lots of us useless messages to read? Well, 'silly' is a euphemism - 'bloody inconsiderate and plain stupid' hit the mark a tad nearer.

Well, we've had a respite for a while and now what do I see? Long for sale adverts in each of the last two issues.

I am sure there are lots of us with things to buy or sell, but I am equally sure that this is the wrong place for it. Please, dear friends who post these messages, ask yourselves how you would like a few hundred of us European ST users to post For Sales which were of no use?

As a committed pacifist I abhor childish 'flames' and hope that kindness and a gentle reminder about the consequences of these actions will do the trick.

Message-ID: <ZMACU06.89Oct31131711@tsun1.doc.ic.ac.uk>
Source record: 247557

Hi,

I have had my 520ST for about 2 years now (it has a single sided internal drive) and recently it has started to play up. The symptoms are mainly :-

1 strange noises during some disk accesses.
2 inability to format disks - very strange noises!
3 a lot of Drive Not Responding errors.

What really confused me was that these errors were sporadic. Some days everything was fine and others it would just NOT work. I initially thought that the head was dirty so I used a head cleaner on it. This seemed to make no difference.

At present I just try to get by on the bad days - oh well....

Does anybody know what could be wrong? I will consider using this as an opportunity to upgrade to a 2 sided internal drive (if the cost of correcting this one is too high).

Thanx for any possible replies.....(mail is preferable for the rest of Net-Land)

Frank.

>
>Roy Good

In any case, the TT/P certainly is "Personal", 'cause it's just
slightly larger than a 1040ST (keyboard separate), with a hard
drive inside the case, plus VME slots in the back... It could
easily sit on a desktop, and the monitor sits nicely on top,
so you hardly notice your TT/P is there at all (a 68030 monitor
stand...).

2255. Posting EDISK

Newsgroup: comp.sys.atari.st
Date: 1989-10-31 15:14:19 UTC
From: OHICEH89@IRLEARN.BITNET
Message-ID: <8911011608.AA16026@ucbvax.Berkeley.EDU>
Source record: 247621

V. Brandt asked where he should post his updated version of ETERNAL, EDISK
By all means post it to Stephen Grimm, most BITNET users,like myself
should be able to get it from here. However some people on BITNET/EARN
have said that they can't access comp.binaries.atari.st or the terminator
archive.
So you should also post it to the BITNET archives :-

LISTSERV@canada01.BITNET (nothing new has been added for ages so maybe it
has died - even though you can still request
files from it)

LISTSERV@FINHUTC.BITNET (This is a fairly recent server so there are only
a few files on it at the moment.)

EARN users (the European side of BITNET/NETNORTH) should also be able to
access the Bradford server (I think this is actually on Janet)

SERVER@marvin.brad.eleceng.ac.uk (this has much of the stuff from
panarthea and terminator.)

While I'm on the subject of mail servers does anybody know if ATARINET
has died or not. Last I heard Michael Vederman was running it but nothing
new seems to have been added since last year. Also is netlib@lakesys ever
going to return as a mail server ? The main reason I use so many servers
is to spread the load of requests over as many servers as possible.

Padraig.

> Jouni Alkio

My main point is that having ONLY one slot guarantees that no vendor will design hardware for that slot. This is because a vendor is competing against others for a very limited resource. Say there were three vendors all wanting to sell a HW card for the ONE slot. But, since there is only one slot all three vendors are competing against each other for use of the one slot. And that is true even if the 3 vendors aren't producing the same function.

Also, having only one slot means that a vendor won't produce a simple board, but will need to produce an all in one board. For example, if you have many slots a vendor might produce a cheap RAM board, but with only one slot the vendor would have to produce a RAM, I/O, video board all in one. Thus a more expensive board and a smaller market for the vendor.

Having multiple slots means that small HW vendors can design special purpose quickly and cheaply. The IBM PC market is an excellent example of this. Having

only one slot means little or no HW support. The Mega ST is an excellent example of this.

So, while I personally may not need or what a AD/DA card for a TT, having many VME slots may mean that someone will produce a board that I do want. And the TT/P with its one partial-VME slot just doesn't allow for any growth.

What would I like to see in card slots?? Well, have about a cheap Ethernet controller, or a cheap tap controller, or a a cheap RAM board, or a cheap INTERNAL modem, or a cheap hi rez color graphics board, or a cheap serial IO card. Heck, there are many HW boards that could enhance the TT. And none will ever be developed if the TT comes out with only one slot.

And that is why I won't buy another closed system from Atari. I would rather wait for the 80486 machines with AT&T Sys V Release 4.0 with X Windows.

2257. question SPECTRE GCR

Newsgroup: comp.sys.atari.st
Date: 1989-10-31 16:14:35 UTC
From: reus@kub.nl
Message-ID: <617@kubix.kub.nl>
Source record: 247630

Does anyone know anything about floppy compatibility between ATARI-1040ST with SPECTRE GCR and Macintosh II. I mean: can I port data from ST to Mac (vice versa) by means of a floppy? Do I need special hardware? Or is sending the only solution?

Please reply to:

> TOS and GEM programs?
>

The new GCC library (distributed with versions 1.34 and later) is partly based on dlibs, and partly on other PD routines. The intention was to provide the maximum degree of portability with UNIX and MS-DOS systems. I think it succeeds quite well; I've used the GCC to port dozens of applications (including NetHack 3.0) with remarkably little effort. There is a GEM library available for the GCC, which seems fairly complete; I can't recall if it was based on gemfast or not. There's also a port of Berkeley's curses package (you can't get much more portable than that :-). All this stuff is available by anonymous FTP from dsrgsun.ces.cwru.edu (129.22.16.2) and probably from other archive sites as well. (Of course, source code is available for everything.)

DISCLAIMER: I'm biased; I helped put together the library, and wrote some of the routines. What I didn't like, I fixed...

> the above MIPS figures are correct.) _Each_ T800 has a processing power
> of 10 MIPS (the upper limit at which instructions can be processed.)

First, there are quite a few misconceptions here. First of all, while a Transputer can crank through 10 million Transputer instructions per second _in_some_cases_, you have to realize that a Transputer instruction doesn't do all that much work. And that Transputer's don't access external memory very efficiently. So unless you're running only with internal Transputer memory, you only get about 2-3 VAX 11/780 (eg, standard) MIPS out of each Transputer. They do far better on floating point, which is really your main concern anyway if you're comparing to a Cray. While Crays are certainly fast, they're hardly 100 MIPS machines. Though a single Cray integer instruction does lots of work (64 bit machine, after all), the real point of a Cray, like most supercomputers, is that it's a vector machine. Which, for problems that can be vectorized, is A Really Big Win.

> So if you have a calculation-intensive application, say one that does ray-tracing,
> you can expect that peek to be reached. If you ran this same program on
> a 13-transputer based ATW, I doubt whether you will see significant increases

> it was specifically written with parallelism in mind - using OCCAM(I guess that
> is the T800 assembly language?) - I don't think there are compilers smart
> enough to take conventional C programs and parallelize them.)

A problem like ray tracing is very easy to run in parallel, and in fact it's one of the best applications to run on a multiprocessor machine. Yes, you have to program the parallelism in this case, but it's pretty simple.

> I am not familiar as to how applications have to be written to run on a CRAY,
> but my guess is that you can use conventional C programming.

Again, the Cray is mainly useful for two types of problems. The first is a problem that lends itself well to vectorizing, and ray tracing works well here too. The vectors are floating point, of course, and images require floating point at any reasonable resolution, so ray tracing is a good match for vector machines. However, as you say, there are vectorizing compilers, at least for FORTRAN, which do a good job at fitting a problem to a vector machine. So far, at least, there's nothing

that's very good at automatically moving a problem into terms a parallel machine can handle. The other kind of problem you hand to a Cray or other supercomputer is a problem that requires several gigabytes of real memory. That's nothing you're likely to be solving on a PC or Workstation for a few years yet.

I once tried a program called "barrel" which would capture printouts
and save them in RAM, print them in background OR save them in a file
(I believe).

Does anyone know if this program is available on GENIE? If you can't
find it, maybe I can dig through my PD disks and send it to you.

Good Luck!

> file transfer, maybe automatic dialing etc. I keep hearing
> about a program called Flash. Is this program any good
> or would you recommend something else ?

There are 2 main comerical Modem programs. FLASH is sold by ANTIC
Software and Interlink by Intersect. I use FLASH exclusively because
I like the builtin script and its editor. Also, FLASH is GEM based
so I don't have to give up my favorite DAs (get MultiDesk real fast!!)
FLASH allows you to build script files (called DO files) which
are run when you get connected to a remote modem. Verry handy to
enter your GEnie account name and number!!

As I said, I don't use Interlink but I have friends who swear by
it. Maybe someone else can explain Interlink.

UNITERM is a pd modem program by Simon Poole and is loved by many
here on USENET. Look for it.

>before anybody munges the command line.)
>

<code omitted>

Wait a sec ... I'm not sure I understand this handle-forcing redirection
(I have to count it on my fingers, you know) ....

But let's assume that the implementor of a C function library uses Handle
2 for stderr, and I launch a program compiled with that library by simply
using Pexec().

Since there's no CR past the end of the command line, the child program
assumes a shell has managed any necessary redirection.

Then the child writes to stderr handle 2, which merrily chatters out the
AUX port, causing my semi-intelligent/mostly idiot modem to have a nervous
breakdown and start calling all sorts of strange numbers at 3 o'clock in
the morning, raising holy Ned all over town and sending sheriff's deputies

with big guns and handcuffs to my door.*

---
* Something like this really happened to a local BBS sysop who
is notoriously poor at typing ... he had mistyped a phone
number in his networking list.

Did I miss a turn back there somewhere? If not, I'd really rather lose the
option of redirecting stderr than have Weird Things Happen in the Night
when thelake is running unattended.

Source record: 247639

In article <23524@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
>I was referring to the feeling of "get in there with a soldering iron and
>fix it yourself" that is endemic in the Atari world.

It's not endemic throughout the WHOLE "Atari world". In the 3 years I've owned the machine, I have yet to rip open the cover and so much as look inside! The uses to which I put the machine are not dependent on hardware modifications. I would expect that the great majority of people who own Atari ST computers fit into the same category.

At the same time, I remember only too well how much of the "get in there with a soldering iron and fix it yourself" attitude was generated by the more technical Macintosh owner, up until the release of the Mac II, when card slots appeared (back in 1987, remember? If memory serves, the Mega arrived shortly around that time period with, lo and behold, a card slot ala the Mac SE)

> Hack in a memory upgrade because Atari doesn't offer one.

I don't know of any manufacturer who offered a memory upgrade on a closed-architecture machine. Apple's own response when asked "How do I upgrade my 128K machine?" was -- buy a 512K machine, or pay the $1000 upgrade cost for the extra memory. Their response when asked "How do I upgrade my 512K machine?" was -- buy a Mac Plus, or pay the $xxxx upgrae cost for a 512K Enhanced machine. Their response to the 512K Enhanced owner was -- Buy a new Macintosh. Some memory upgrade! Ditto with IBM, or have you noticed them upgrading PC's past 640K of memory on anything less than an 80286 machine?

>Rip out your CPU to kludge in a faster processor, since Atari hasn't offered
>anything in 5 years.

Correction ... 4 years. And only if you don't consider the new to-be-released machines. Seems to me that the Mac Plus (3 1/2 year old technology at the time) and the Mac SE (4 year old technology) didn't offer a faster processor either. I'd certainly like to know what people are using for comparison!

> Tear out your Shifter chip to add colors to bring your system up to the level
>that other manufacturers now sell.

Actually, this is no more of a hack than third-party attempts to give machines like the Macintosh color, except _there_ you have to pay $1000s in order to get color on a black and white machine at all...

>How many DEC VAX customers are going to go out and "burn a XXXXX EPROM
>instead of two XXXXX Eproms and switch between the $0000 and $FFFF
>address areas"..? When was the last time your VAX had to have chips
>piggybacked or held in place by double-sided "sticky tape"..?

Of COURSE DEC provides more support -- and they CHARGE for that support!

For example, to maintain a VAX 11/750 with a 450 megabyte
disk, 8 megabytes of memory and a tape drive would cost well over $15,000
per year. At that price, I don't expect to have to LOOK at the hardware
when something goes wrong, let alone work on some makeshift repair.

>Atari makes a lot of noise about becoming a real presence in the business
>world, but falls far short of the kind of performance that business is
>going to require.

The people who provide the "performance" are not the manufacturers, but the
dealers and software vendors. Hardware is a platform for useful work --
while it is nice if the hardware manufacturer encourages such support, if
they are TRULY to manufacture hardware, they can't get into the software
business, or the repair business. Even Apple Computers recognizes this fact,
which is why the spun of Claris to separate their hardware and software
divisions.

I've gone on so much because I'm getting pretty tired with people _telling_
Atari what they need to do ... especially when that _telling_ is nothing more
than thinly disguised kvetching. You don't like the hardware/software, you
can "vote with your money". Just don't repeat that you're GOING to do so if
they don't "get their act together". Do it, and then leave this forum to
those who want to put what they've GOT to better use.

For those who extol the -386 machines -- BUY one and then wander over to the
IBM PC forums. You can kvetch there at IBM/Compaq/Microsoft and leave the
rest of us in comparative peace.

2268. v03INF1: Introduction to comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1989-10-31 21:08:10 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <34651@grapevine.uucp>
Source record: 247641
Cross-posted to: comp.sources.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 3, Info 1
Archive-name: intro

This is the first of two introductory articles about comp.sources.atari.st.
This one describes how to submit source to the newsgroup, where the
archive sites are, and how to contact them. The companion article lists
all previously-published sources.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@panarthea.ebay.sun.com

--------------------

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to
atari-sources@panarthea.ebay.sun.com. If you are on a UUCP-only site, you
can send them to sun!ebay!panarthea!atari-sources. In Europe, send your
submissions to Jan-Hinrich Fessel, the European submoderator of the group,
at unido!atari-sources (or, if you're a masochist, atari-sources@unido.
informatik.uni-dortmund.de.)

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, source
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a
pain to separate them, and such submissions are invariably placed on
the back burner. Sources should be submitted in "shar" format, plaintext
and split up into reasonable (less than 50K) chunks, unless you don't
have access to a shar program, in which case "arc" is all right.

Please inform me of any special system requirements, and what development
environment was used, so that I can properly test your submission and
label it when I post it.

--------------------

Subject: The structure of comp.sources.atari.st articles
```

Each posting in comp.sources.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.sources.atari.st: sources and "information postings." They can be distinguished by the subject line:

Subject: v03INF3: Index for Volume 1 and other info

This first word in the title identifies this as the third info posting of volume one. Similarly, the subject line shown below:

Subject: v03i081: tossrc -- Source code to TOS

identifies this as the 81st source article in Volume 3. Large sources are broken up into smaller pieces, and have subject lines that look like this:

Subject: v03i082: VMS clone in ST-LOGO, Part03/08

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: MWC, Megamax, 1meg, high

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

Alcyon - Alcyon C (included with Atari developer's kit)
MWC - Mark Williams C
Megamax - Megamax C
Laser - Laser C
Lattice - Lattice C
C - Any C compiler
OSI - OSI Personal Pascal
BASIC - ST BASIC (this is not a joke!)
uuencode - program is uuencoded (uudecode required to unpack)
arc - program is archived (arc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 3, Issue 80
Archive-name: micro-rtx

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Please try to use this name when requesting that sources be mailed to you. Also, note that the "part number" given in the title, and the archive name given in the auxiliary header need not be identical.

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do try to limit filenames to eight characters whenever possible, though.

Subject: Reporting and tracking bugs and patches to postings

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

Subject: Listing of archive sites in no particular order

1. Site panarthea is running an archive server, which automatically answers mail requests. Send mail to archive-server@panarthea.ebay.sun.com with the word "help" in the message body for more information. Both the sources and binaries groups are archived on panarthea.
2. Unido is the European archive site. It's running an archive server similar to panarthea's; send "help" to unido!archive-server for more information. Unido archives both the sources and binaries groups.

If you know of additional sites which reliably archive comp.sources.atari.st (or comp.binaries.atari.st, for that matter), please tell me so I can add them to the list.

> Whatever happened to the 'Set environment & find TOS version etc' accessory
>that someone@Atari (either apratt or kbad, can't remember) promised? Does
>it exist? Is it in the queue? Or do I have to write it myself??

well, if you can wait just a couple of more weeks for the Quick Utilities
1.6 shareware release, you will have this exact feature built into Quick ST 1.6
and have the ability to edit the environment (in Laser C style) using
Quick Inf 1.6. Quick ST 1.6 will automatically load an environment file
at boot up time, which becomes the default GEM environment. Quick Inf 1.6 will
allow you to edit, load or save that environment at will.

like you say, utils such as these have to be written by the users of the
atari st. atari itself doesn't seem to care.

btw, it kbad back from his extended holiday yet???? or has he been nuked??
(if so, that's one hell of a bad move atari!!!!!)

(From "The Masked Rat Fink" "Computing and Informatics Yr4")

Having just read a message in Vol. 89 Issue 565 questioning whether there is a shell available for Sozobon C, I would also like to second this question!

I am starting my final year project using Sozobon C and would find a shell _VERY_ useful, espesially if it can handle environment variables.

I would also like to take this opportunity to make clear my appreciation of what can only be described as a wonderful package! I was looking to spend money on a C compiler for my project and had even considered the radical thought purchasing MWC, but having seen sozobon I immediately stopped looking any further. There ... that's probably enough praise even for Sozobon!

I'd just like to say that I am not related to/sleeping with any of the Sozobon team, I just think their product knocks seven bells of anything you care to mention out of all other compilers!

Thank you for reading this drivel, I'll get of my soapbox now!

Simon

As far as I know TOS 1.6 is enchanced TOS 1.4 and it includes all that
TOS 1.4 does plus routines for controlling the STE's special features.

Boy, you can say that again.

You blamed TOS 1.4 for something which may or may not work on STe. STe doesn't run TOS 1.4, it runs TOS 1.6, but there are other differences which can make a program break. There aren't many, and they're minor, but they still exist.

One BIG one is the new base address of the ROMs. You'd be surprised how many programs assume the ROM starts at a certain address, and go straight to that address to get some information (like the ROM version number). You can learn the OS header address by looking at the system variable _sysbase; the OS header contains, among other things, the base address of the OS. It's not always in ROM (witness RAM TOS 1.4) and it certainly isn't always in the same place.

If you go to $FC0000 for the ROM header, you will lose on STe. You will get a bus error and die horribly.

Let me take this opportunity to say that the correct date for TOS 1.4 ROMs, as seen at offset $18 in the OS Header (OK, OK, at $FC0018) is 04 06 19 89; that's 4/6/1989.

2277. CMI update... I got screwed royally...

Newsgroup: comp.sys.atari.st
Date: 1989-11-01 00:28:18 UTC
From: uace0@uhnix2.uh.edu
Message-ID: <883@uhnix2.uh.edu>
Source record: 247645

Well, in case you never saw my original posts concerning the CMI accelerator board, to summarize, I couldn't get it to work worth anything, plus my ST got fried in the process.

So... They offered to fix any ST damaged from installation for $50...
I sent my ST to them (second mistake - first was buying the damn board) over 2 months ago.

They called me up and said they couldn't fix it, and were going to send it back to me. That was close to 2 weeks ago, and still no ST or a refund check of $300.

Well... I called their number today and guess what - 'The number you have dialed is no longer in service...'

So now, CMI has my $300 and my ST!!!! I am fuming mad, and would suggest that if anyone else out there is even considering doing business with this company to completely put it out of your mind!!!

I have since contacted my local postal inspector and discussed the matter with him, and since the US Mail was involved, they are extremely interested in following up with mail fraud action...

I was hoping to just get my money back, and my ST (albeit it would be broken), but now it looks as though my hopes are completely dashed. BNut, I am sure that involving a federal agency will at least put the screws to these people big time...

Total cost to me now, has been - $300 (accl bd) - $500 (1st ST) - $300 (2nd ST)
Total cost = $1100 !!!!!! Look slike I got screwed, and I didn't even get kissed first!!!

This really hurts, since I don't have much money to begin with, now I have even less... Try to deal with a company and give them the benefit of a doubt...

If anyone is close to Tualitin, OR, please let me know. I'd like to hire someone for a small fee to do some dirty work...

- mike

Point a: average atari user's won't buy Unix (sVr3.2, I believe it's
to be), which is fine. They need it like a fish needs a bicycle. Unix
will be the preserve of the business work-group users and more
sophisticated home hacker types.

Point b: I'm not planning on buying into all that missed'em 5 grief
;-), the machine's got a 68030 in it so the MACH port ought to be
pretty straightforward. I sincerely hope so, anyway. I'll run minix
until it gets done - at least I'll have source. Physician, heal thyself!

> design hardware for that slot.

See, for example, the Mac SE, for which you can buy all sorts of interesting
cards. Vendors build cards for machines which lack features and which
have profit potential.

The TT comes with most of what you'd ordinarily put into slots. Serial I/O.
High-performance video. A place to plug RAM SIMMs.

The marketing trade-off is this: the average user don't need 5 cards. If
he does, he buys the more expensive machine TT. The PC wasn't that way -- it
lacked so many features that you needed a bunch of cards.

Your mileage may vary.

Now if you can produce a bunch of users who have more than one card in their
Mac II (excluding a "normal" video card), let us know.

2281. Re: Piggiback ROMs (2 TOS versions

Newsgroup: comp.sys.atari.st
Date: 1989-11-01 04:14:34 UTC
From: la062594@zach.fit.edu
Message-ID: <657@winnie.fit.edu>
Source record: 247647

I just received the TOS 1.4 eproms from a dealer in Orlando. While it is ATARI's official policy that the roms should be installed by an authorized dealer, I opted to do it myself, as the inside of my 2.5meg 1040ST isn't too pretty. The installation itself was pretty easy. Since my 1040 had a 2 rom set initially, I had to remove three solder connections and make 3 solder connections. (The locations inside the machine are obvious, as they are marked plainly....) Anyways, I booted up the machine and it worked right away! I tried running every program that I use on a regular basis, and every program worked fine. I even tried a few of the games that other users mentioned, DM, Rick Dangerous, Lost Dutchman's Mine, etc. and all worked fine. (With Lost Dutchman's mine, I had to remove STARTGEM, and install the actual program as an auto boot). I imagine there are a number of programs out there which do break with this TOS, but so far so good......

I have been reading many complaints lately about the price of TOS1.4, and while I have to agree that $99 is a bit steep for me, the comparisons being made to other machine are hardly fair. One fellow compared this upgrade to Macintosh's system upgrades which are free to Mac owners, but shouldn't the comparison really be to the cost of a 512K mac owner upgrading from the 64K roms to the 128K roms? (no path even exists for them to upgrade to the 256K roms in the Mac II). It would be nice if ATARI were releasing programs like NEODESK for free, but this just isn't realistic. If ATARI charged us in advance for user support like Apple or IBM (i.e. jacked up prices) then we should expect a bit more. Maybe the current line of computers hasn't mad it in the business world, but show me one other machine that can easily run three separate operating systems at anywhere near the price! Don't get me wrong, I think ATARI needs to do something more for the US market. The wait for TOS1.4 was ridiculous, and the STACY and the TT may as well not exist at all if they aren't released soon, but let's keep things in perspective. If anyone owns an ATARI ST, then I assume that person made a concious decision to purchase it. Since nothing can be done about which computer you own short of selling it, make the best of it. If half the people complaining on this board spent some time developing hardware or software, there would be nothing left to complain about.

One last comment.... I recently purchased Signum2, a document processor distributed here in the states by ASD//Megamax, and written by Application Systems Heidelberg. This program is GREAT!! I am currently using it to write my thesis as I haven't found any package (including EXP, Latex, etc.) with the ease of use and versatility of this program. Check it out...

2282. PD Midi-dump filer for the Atari

Newsgroup: comp.sys.atari.st
Date: 1989-11-01 10:22:40 UTC
From: tonyj@UNIXA.CLP.AC.UK
Message-ID: <8773.8911011022@unixa.clp.ac.uk>
Source record: 247649

Does any one know of, or has anyone written, a simple program for filing MIDI bulk dump information for the 520ST ?

I have an Oberheim Prommer sampler, which has no real storage facilities. However it can be persuaded to dump all its data (about 64k) over MIDI. What I need is a program to store this information to disk, and to read it off disk and send it out again at a later point.

I'm sure that if I knew more about 68000 m/c and the ST, it would be a very easy program to write. I'm not worried about being able to edit, split up or move the data around, I just need to write it to memory or disk as it comes in, so I don't need one the flashy generic dump editors that are on the market. However, I'm sure some one must have written a program like this ...

I have a 520ST with Med-res screen ONLY.

Thanks

GNU C isn't really worth using on a 1Mbyte m/c. I tried it and it works only for trivially-sized files. You'd also have *major* problems fitting it on a SS disk. Sorry.

Could someone please e-mail me an encoded GEMQ (AESQ & VDIQ) library
implementation or information on a BBS that has it, I was sent a copy,
but it would not uudecode.
Very much appreciated,
-Spieu!
P.S. Has anyone else experienced the following problems with OPUS2.2
1) Right justified numbers hang into the following column,
even the row numbers.
2) When installing my WORDUP2.0 GDOS with it, it would say
printer fonts do not match screen fonts even after
assigner and fontwid, so I edited them and found that
the NECP7 printer fonts contained half of their listed
point size in the fourth byte and set it to their corrected
size. Now opus boots, but when it prints, the fonts are
currupted.
3) Spline doesn't produce a smooth curve on my KXP-1124 even
at 360 resolution and 1 step.

Any help very much welcome...
-Spieu!

>Workstation (ATW). There is an article in the November STart.
>
> Here are some of the highlights :
>
> RISC (reduced instruction set computer) running at 50 mHz
RISC: Not really true. Ther T800 Transputer is a "processor" that is
said to be a RISC processor, but the instruction set ist a lot larger
and nicer than 6502 :-)
Almost nobody will do serious programming on this machine in assembler.
The multiple opcode instructions always drive me crazy :-)
> With all 4 boards, that is 13 transputers, the machine
> runs at 10 MIP (= 1/5 Cray)
MIPS: Most Insane measurment for Processor Speed.
MIPS: Marketing Instrument for Pushing Sales.
MIPS won't tell You, how fast the machine will do Your job.
Transputers work fast when pushed to the limits. The network layout (the
Transputers have "links" - high speed (5, 10 or 20 MBit per second)
serial interfaces with DMA - to exchange data and code among each other)
is a critical factor as ist parallelism of the program.
There is an optimal network; one for each given task :-)
> Helios OS (UNIX-like) with both CLI and Graphic interface
HELIOS is - or will be? - POSIX compatible; it's very much Unix but it's
different, of course: Transputers are different.
Multitasking was introduced to have all that expensive equipment
(processor, I/o, disk, card reader/puncher, hardcopy terminal) busy -
doing work - all the time; to have the processor doing another job,
while the editor is waiting for You to press the "ANY" key.
Multi-processor systems do not just make multitasking faster. A four
processor computer can be faster than for single processor machines.

The ATW HELIOS comes with csh-like command line interface and X-Windows
for graphics.

HELIOS is not ATW-specific.
One of the development team showed a version that booted on an AT-clone
equipped with an Inmos B004-clone (the B004 was one of the first Transputer
evaluation board from Inmos; the clone is the TEK4/8, the building
instructions were published in the german magazine c't)

A T414, T425 ot T800 will not run Unix faster than a - say - 68030 or
80386 at compareble clock frequencies.
It will to a better job on programs, that have independent tasks running

simultaniously. The Transputers do the basic multitasking in hardware
(!). Inter process communication (for multiprocessing) and multitasking
are very much supported by the hardware. Virtual memory is not.

Source record: 247551

Hi there,
I am trying to find out if there are any 3D-reconstruction packages available either commercially or in the PD. These packages are primarily used to reconstruct a series of 2D outlines into a 3D image eg. the reconstruction of a series of sections cut
through a cell or leg! to give an overall image of the object before it was sectioned. Other capabilites usually include the ability tomeasure cross sectional areas, volumes and other morphometric measurements.
I would also like to know if there are any other ST'rs out there who usethese machines in a scientific environment, if so, what do you use them for?

Thanks,

>it was specifically written with parallelism in mind - using OCCAM(I guess that
>is the T800 assembly language?) - I don't think there are compilers smart
>enough to take conventional C programs and parallelize them.)

True.
Well, OCCAM is not the "transputer assembly language", but it's the
language everybody uses for a start...

OCCAM ist very much compareble to C: it's a high level language that is
pretty close to the processor.

OCCAM and the T's were made for each other; OCCAM has high level
language contructs, that can be directly mapped to hardware funtions.
For Example there is the construct

```
PAR
SER
procedure1(foo)
procedure2(foo)
procedure4(foo)
output(foo)
ENDSER
SER
f1(foobar)
f3(huhu)
f1(huhu)
ENDSER
ENDPAR
```

This will run procedure[124] after each other *while* running f1(huhu)
after f3(huhu) after f1(foobar). The multitasking is done by the T's
hardware (microcode counts as hardware to me if it is burned to the

microcode ROM, not booted off disk).

Another contruct is the "channel". Channels are - kind of - pipes where a taks puts in some stuff to be received by another task. The sending task is held until the message is received by the receiver. This can be used for task synchronizing and inter process communication.
If the receiver task runs on the same Transputer (chip) (well, it's probably not running but "sleeping for input"), the channel is mapped to a memory location, probably a location in the T's on-chip-fast-nowait-RAM.
If the receiver ist running (sleeping) on another Transputer, the channel will be mapped to the one of the four (eight in case of T222 or so) "links"; thel ink connected to the other T.

The links are used to connect Transputers with each other.
In an advanced Transputer system there will probably be some link switch chips (there are availeble from SGS Thomson/Inmos). These are kind of crosspoint switches (like the ones used in telecommunication). With these, the network of Transputers can be reconfigured by the system software, while the system is up and running.

Well, face it: the softies just cannot handle systems like this at this time. It's much to different from classic computer systems.
To me, parallel programming is a more new way of thinking (like object oriented programming) than just programming a new machine.

OCCAM is a high-level language designed specifically for writing parallel
applications. There are many (relatively speaking) C compilers that will
produce parallel code, f.i., in the IBM world, MicroWay sells a number of
co-processor/T800 boards. Available for these boards is a parallel C and
FORTRAN.

Ahh... Atari ST GEM programming. I unfortunately chose to do my senior
comp. sci. project on an ST without knowing anything about the programming.
This was a boo boo.

In article <30200009@inmet> hedger@inmet.inmet.com writes:
>3) I have been trying to learn about programming GEM applications.
> I have the MWC documentation and the Balma Fittler book on GEM.
> I have a little experience with C (I'm learning) and I've never
> written any software using any windowing system.

C experience is a definate plus. Some of the things can get a little
hairy. Like grabbing text out of an editable text field in a dialog box.
That one was weird.

> I'm confused.....I have a program that hopefully will display
> a window on the screen. I have been able to get the window to
> appear and look for me to hit the 'close' box. I notice that
> I have to apparently trap the cursor movement to the sliders,
> bar at the top(to move the window), or the shrinkbox thingy.
> I have my program setup using evnt_mesag() to wait for these
> but I don't know what to do when I get one of them.

basically, you set up an event loop. looks like this.

```
while (TRUE) { /* i.e. forever */
event = evnt_multi (parameters up the wazzoo);

if (event & MU_MESAG)
handle_message ();
else if (event & MU_KEYBD)
handle_keyboard ();

etc...

} /* end event loop */
```

Then, say, for most window stuff, you drop into the handle_message
function. In there you have a switch statement for message types, defined by
Laser C as things like WM_REDRAW, WM_CLOSE, WM_FULL, etc. Each of those
message types will have a function related with it. i.e. a WM_REDRAW message
would be handled by a function that went through the window's rectangle list,
set some clipping rectangles, and redrew the contents of the window.
If anyone has specific questions they can't find in a book, feel free to ask.
This is a real brief overview. Obviously.

> Is there a book that will tell me step by step what needs to
> be done to write a very simple GEM application?

I'll tell ya', I sure as heck haven't seen one. I looked. I looked a lot. I begged, pleaded, cajoled. I lost. What I did find was that PROGEM series available by ftp from terminator.cc.umich.edu. Some were helpful, some weren't.

>4) What is the relationship between a window and a workstation in
> GEM ?

a workstation is a physical device, whereas a window is a data structure placed _on_ that device, assuming the device is a screen. Us mortals (that don't feel like some serious OS hacking) cannot use physical workstations, we must use a virtual workstation. Then once we have that opened, we can draw on it, spit out text on it, etc. I haven't worked with any other device type than screen, so don't know much about anything else.

>5) How do you make a GEM program display data in one (or more) of
> the windows/workstations you've created ?

God, that sounds familiar. Text-to-GEM-windows? Asked the same thing myself a few months ago. Two people repsonded, I think, and pointed me in somewhat the right direction. ya' gotta do a v_gtext, but the tricky part is to actually get it into the window. i wrote some routines that would put text to a window anywhere on the screen (if on top at least, suited my application okay) by setting the clip to the window, finding the window's current location, getting current character width and height, and giving it a _character_ x and y location. it then translates this into actual pixel locations and spits it out.

>(see I told you I was confused....! :-))

probably more confused now. i know i am, it's really quite a bit too early for this. (6:30am |-)

2291. VME bus

Newsgroup: comp.sys.atari.st
Date: 1989-11-01 12:38:33 UTC
From: dnewton@carroll1.UUCP
Message-ID: <809@carroll1.UUCP>
Source record: 247554

Question: I know absolutely nothing about the VME bus except that it exists. Are the slots individually addressed? Or would it be possible to build a bus extender that would give you more slots with little cost save for some drivers? Hence making the as-yet mythical TT a multi-bus (oops, getting the ol' busses mixed up) machine?

Just wondering.

2293. perl beta release

Newsgroup: comp.sys.atari.st
Date: 1989-11-01 15:44:09 UTC
From: piet@cs.ruu.nl
Message-ID: <1758@ruuinf.cs.ruu.nl>
Source record: 247563

I have ported Larray Wall's perl program to the Atari. It will be ready for
a beta release next week. If you want it, send me a mail.

THE REQUIREMENT IS THAT YOU WILL USE IT AND SEND ME BUG REPORTS.

This version is based on Larry Wall's gamma release and I am going to
switch over to the official version after the beta release.

Here is a small description:

Perl is a interpreted language optimized for scanning arbi-
trary text files, extracting information from those text
files, and printing reports based on that information. It's
also a good language for many system management tasks. The
language is intended to be practical (easy to use, effi-
cient, complete) rather than beautiful (tiny, elegant,
minimal). It combines (in the author's opinion, anyway)
some of the best features of C, sed, awk, and sh, so people
familiar with those languages should have little difficulty
with it. (Language historians will also note some vestiges
of csh, Pascal, and even BASIC-PLUS.) Expression syntax
corresponds quite closely to C expression syntax. Unlike
most Unix utilities, perl does not arbitrarily limit the
size of your data--if you've got the memory, perl can slurp
in your whole file as a single string. And the hash tables
used by associative arrays grow as necessary to prevent
degraded performance. Perl uses sophisticated pattern
matching techniques to scan large amounts of data very
quickly. Although optimized for scanning text, perl can
also deal with binary data, and can make dbm files look like
associative arrays (where dbm is available). If you
have a problem that would ordinarily use sed or awk or sh,
but it exceeds their capabilities or must run a little fas-
ter, and you don't want to write the silly thing in C, then
perl may be for you.

Hi ppl
Just a word about the 386 TT discussion.
One of the greatest disadvantage of the Atari STf compared with the PCs was that the STf was a "closed" machine. With a PC, you were at least able to buy upgrades and to adapt a machine to your specific needs. People wanting to work in the fields of data bases can buy a cheap and rather slow machine along with a highly efficient storage device. I hope that some folks in Sunnyvale will think more about this in the coming times.

The following is a bit long but I grabbed this from the Amiga net.
Of particular interest are items indicating product delays for all makes
of computers and software. See, it is not just Atari having problems
on getting products out.
Also, be on the look out for an item stating that the Mac laptop
is not yet available (???????????).

Comdex Fall '89.
November is Comdex month. Among the announcements expected
are: a bevy of i486 EISA computers, including a system from
Grid, the Sharp PC 8000 color laptop (prematurely announced
in an accidental press release at PC Expo in Chicago last
month), the Zenith 386SX-based color laptop with 1 Mbyte of

RAM and VGA graphics listing at $2,995, and several PC HyperCard clones, among them Plus for Presentation Manager from Spinnaker Software.
- MacWeek 19 September, PC Week 9 October, and InfoWorld 9 October

Merry Christmas From Big Bluegrass.
Once again IBM plans a foray into the home market with a line of low-cost home computers starting at $700. Code-named Bluegrass, the line will have two more expensive models and a variety of memory, speed, and hard drive options.
- PC Week 9 October

SCAT.
Chips & Technologies has announced the 82C235 Single Chip AT (SCAT) which will allow manufacturers to build an AT compatible motherboard using as few as 14 components plus memory. The SCAT is available at 8, 10, 12.5 and 16 MHz and can drive up to four expansion slots. The chip will be available in sample quantities this month.
- InfoWorld 9 October

Apple, Microsoft Font Alliance.
Apple and Microsoft have announced a cross-license agreement which gives Microsoft Apple's outline font technology, code-named Royal, for use in the OS/2 Presentation Manager in return for Microsoft's PostScript-clone technology for use in future Apple printers. Rumors of the agreement precipitated a decline in Adobe stock from $23 to a 52-week low of $15 5/8. Adobe announced plans to buy back up to $15 million worth of common stock (about 4.8% of outstanding shares).
- InfoWorld 25 September and MacWeek 19 and 26 September

Widening and Extending the Micro Channel.
IBM announced that later this year they will make public technical specifications on how board makers and MCA system manufacturers can quadruple the current 20 Mbyte per second transfer rate. Entry Systems vice president Robert Carberry emphasized that the specifications are not a change in the MCA architecture. IBM also announced plans to extend the Micro Channel beyond PS/2s to scientific workstations and select System/370 mainframes.
- PC Week 2 October and InfoWorld 2 October

HP's EISA i486 Tower.
Hewlett-Packard has announced the Vectra 486 PC, a tower-style PC based on Micro Channel rival Extended Industry Standard Architecture (EISA), for shipment in January. The 25 MHz computer offers hard disks ranging in size from 84 Mbytes to 670 Mbytes with announced prices of less than $14,000 to around $17,000. - PC Week 16 October

Second Generation RISC Chip.
Although operating system problems have delayed the announcement of IBM's new RT-3 line (see the September and October columns), Big Blue has officially divulged details of their new, second generation RISC processor in three technical papers presented at last month's IEEE conference in Cambridge, Massachusetts. Among other attributes, the new chip is able to execute multiple instructions simultaneously, a capability critical to multiprocessing. - PC Week 16 October

RISC Workstation Running OS/2.
Microsoft and DEC are said to have the OS/2 kernel up and running on a workstation built around the Motorola 88000 RISC CPU. - PC Week 9 October

Intel i960 Doubles RISC Performance.
Intel has announced the 32-bit i960 RISC chip which is capable of 66 MIPS at it's 33 MHz clock speed (two instructions per cycle and nearly four times as fast as the 33 MHz i486). The i960 was developed for real-time and embedded systems applications and can increase the speed of page publishing printers by as much as six times. According to Intel the i960 will be available in the second quarter of 1990. - InfoWorld 18 September

Open Systems Foundation Switches to Mach.
The Open Systems Foundation has told its members that it may swap out the IBM AIX kernel from its operating system and replace it with Carnegie Mellon University's Mach. The reason for the move is the superior multiprocessing capability and security of Mach. Industry analysts doubt that OSF/1 can meet the announced July 1990 availability date after such a dramatic change in the operating system's contents. - InfoWorld 2 October

What NeXT?
Although more than 50 vendors have announced plans to introduce products for Steve Job's NeXT computer, only a handful will be available by the end of this year. Graphics and publishing professionals are eagerly awaiting a color display, but Steve Jobs has indicated that one won't be available until NeXT, er next, year. NeXT plans to by-pass eight-bit color and introduce a full 32-bit color display. In order to assure adequate performance, the company is developing a custom video chip and accelerator for manipulating 24-bit color images. - NeXTWeek 19 October

IIgs Laptop.
Although the LapMac finally has been announced, it may be several months before it is readily available. Rumor has it that Apple has a project code-named "Malibu" to use the matrix display and battery pack developed for the LapMac in

a laptop IIgs. It would be nice if they'd sell the display all by itself for all those //c owners who have never had a monitor as portable as their computer.
- Thanks to Lynda Botez for passing this along from the Cupertino NewsNet

Splashy Product Rollout Scheduled for March.
Apple has booked the hall for a major product announcement in March. Details of exactly what's planned remain sketchy, but the best guess at this point is that it will be the long rumored Mac-Tower and a new family of QuickDraw laser printers. - MacWeek 3 October

Better Laptop Battery.
Moltech Corporation is developing a new battery for laptop and notebook computers that will have five times greater storage capacity than current nickel-cadmium or lead-acid batteries. The new "thin-film" batteries use solid polymer electrolytes. Polymer batteries also are less expensive to manufacture, but they are likely to be sold for higher prices initially because of their reduced size and weight and increased usable lifetime. - Random Access 23 September

3-D, Full-Color Animation.
Electic Image is set to ship Spotlight, a 32-bit color 3-D rendering and animation program, in January 1990. The $7,495 program requires a Mac II family computer with a minimum of 2 Mbytes of RAM and a large capacity hard disk or optical storage system. Spotlight brings broadcast quality 3-D animation to the Macintosh. - MacWeek 3 October

Cache a Faster Mac IIci.
Apple plans to announce a cache board for the Macintosh IIci later this year. One already is available from Daystar Digital for $995. The board produces an up to 40% increase in speed according to Andrew Lewis, president of Daystar. Mr Lewis also said that cache boards increase speed less expensively than accelerator boards. Daystar makes 33, 40, and 50 MHz accelerators for the Mac II and IIcx, and is expected to announce accelerators for the IIci by the time this column appears in print. - InfoWorld 2 October

Serious Video Game.
Nintendo plans to start an online financial service to be run by Fidelity Investments of Boston. The service will use a standard Nintendo game unit as a terminal. Software and hardware for connecting to a telephone line are due in 1990. - Random Access 14 October

But Will It Bag 'Em?
Prodigy, the telecommunications joint venture between IBM and Sears, is test marketing grocery shopping by

telecomputing in three cities. Prodigy expects its basic service to be available to 40% of American homes by the end of this year. - Random Access 14 October

Macintosh System 7.0 On-Schedule?
Apple executives are cautiously optimistic about progress on the announced new Macintosh operating system software. Last May, Apple indicated developers would begin receiving seed modules of the new system in the fall. Ed Birss, Apple vice president of product engineering, now says "Developers will begin getting code before the end of the year." Apple had planned on shipping System 7.0 in the first quarter of 1990, but officials now acknowledge that not all of the core technologies announced last spring will be ready to ship at the same time. One problem which remains to be dealt with is the system's size. Developers recently assembled and linked an alpha version and consumed 1.2 Mbytes!
- MacWeek 3 October and InfoWorld 9 October

Word For Windows.
Microsoft has not announced nor shown developers its Windows version of Word, but those who have seen the beta software say that it is an entirely new product with more differences than similarities to the DOS product.
- InfoWorld 2 October

Deja Vu.
The vast delay between the originally announced release and delivery dates of Microsoft's Windows brought the word "vaporware" out of the realm of jargon and into general use. Hence, it should be no surprise that Microsoft cannot ship Windows 3.0 (see last February's and July's columns) by year's end as originally planned. "Immature source code" and the lack of a full set of device drivers will keep Windows 3.0 at home in Redmond until March or later. When the program finally is available, users will find that many of their Windows 2.1 applications will not run in protected mode; while those applications can run in real mode, they will be restricted to 640K. An obvious problem is that both Lotus 1-2-3 Version 3 and dBase IV rely on Rational Systems' DOS extender, but Windows 3.0 will be ir-Rational.
- PC Week 17 September and 16 October
and InfoWorld 16 October

dBase for Windows.
Two versions of dBase IV for Windows have been shown to developers in recent months. Ashton-Tate programmers are working on a "core program" that can be rapidly ported to a wide range of environments including Windows, X Window, Motif, Presentation Manager, and Macintosh.
- InfoWorld 16 October

Lotus 1-2-3 Update.
The graphic 1-2-3/G for the Presentation Manager (see last August's column) now has a scheduled delivery date of 23 March 1990. Macintosh 1-2-3 is slated for March 1991.
- PC Week 16 October

Plans for Excel.
Microsoft's product manager for Excel, Susanne Foels, said the next version of Excel will permit users to mix graphics and worksheets on the same page and also will contain three dimensional charting. - InfoWorld 16 October

>Uniterm is a nice program (thank's Simon). But let's get real. I want
[...]

what is really funny is that Apple's support of the][series was the
entire reason I switched to Atari in the first place!!!

Apple announced the][x - a 16-bit][e compatible computer approximately
three years before the][gs finally came out. I had been waiting for it
for the whole time, and purchased my 1040ST approximately 4 months after
the][gs came out on the market. This was simply because it was so over
priced for the relative power it offered I said, "screw it!"

well, now that I have left the APPLE world, I am never going back, so if I
end up leaving the ST world, it will also be for good - I hate companies
which screw their users around like this.

Well, I guess I will wait until the TT comes out, and then make my real
decision. It would be a terrible feeling to know that I purchased one
of those damned 386's and then saw how wonderful the TT was.

> laser printer you can't turn on the controller box with the printer turned off.

I have found that by opening the back cover the main printer
mechanisms is disabled just leaving the power supply on: hence
keeping power on the control box. The power supply appears to
remain at a reasonable temperature even after lengthy periods.
However after using the printer the fan should be allowed to run
for at least five minutes.

As far as I can see there is no problem with this method.
However I am not certain, is there anyone out there who can
comment.

> Summary: More then one slot

> My main point is that having ONLY one slot guarantees that no vendor will
> design hardware for that slot.

That's certainly not true in general. A good example is the Macintosh SE and SE-30. These machines have only one slot (different ones, to boot), yet Macintosh developers have come up with various goodies to put in those slots.

What you probably won't see is much diversity. There are processor accelerator boards and video boards for these Macs, and apparently quite a few of them, but not much else. There's always one or two things that lots of folks want to add to there machines; you won't get the interesting stuff until there's a place to put them after the basic addins are in place.

2304. Re: Self-Modifying Code

Newsgroup: comp.sys.atari.st
Date: 1989-11-01 17:48:13 UTC
From: mackeown@CompSci.Bristol.AC.UK
Message-ID: <1037@csisles.Bristol.AC.UK>
Source record: 247574

Another obvious reason for not writing self-modifying code is it won't work when programmed in ROM, PROM, EPROM/EEPROM etc.

It could copy itself beforehand into another more writeable part of virtual memory (e.g. on-line magnetic storage media) but then the expensive, non-volatile electronic memory would be wasted.

If you buy a Mac Plus, for example, it doesn't expand by itself. You must buy a new model. How can a new model help you if you don't buy it? And I guess the Mac Plus is still selling much more than the newer (and more expensive) models. I admit that Atari hasn't brought many interesting ST-computers lately (I don't like the MEGA ST's), but that doesn't really matter, I've been quite satisfied with my good old ST.

>>Do you think introducing a PC-pocket clone is playing. Many people

Why should a PC-pocket clone benefit us ST owners? There are the new ST-models, too (and the TT's). And what is a gadget for you is not necessarily a gadget for some other people.
>
>>Do refer to the TT as nonstandard?

As I understand you, all which is not a PC-clone, Apple-clone or something like that can't possibly be a standard. Well, if so, how could anybody introduce a new standard computer (not clones)???? They are automatically non-standard if they aren't clones.

>
> ST programs are by definition "non-standard" because they run on the

> and Apple II have become).
>
And after all, how do you know where the line goes between standard and
non-standard? If you use the market share as the criteria, the ST could
very well be called a standard in West-Germany, for example. I doubt
Apple is selling much more there.

>>Haven't you heard of the Stacy and the ATW? They are not video games.

CD-ROM drives are (as far as I know) available in Germany. Stacy, too.
And think ATW will be very soon. And you don't have to believe all what
you hear. Atari has now "promised" that they won't introduce a new
device before than three months before the first shipments. I hope
this will make your life a bit easier.

>

Again, if you think the ST as non-standard, it's your problem. You could
buy another computer and stop complaining. It's so simple. If you don't
want it, you don't have to keep it.
>
> The ATW is not a video game, but it's not something that's likely to benefit
> you or me. Development of the Atari ST computer line _would_

The people who have an ATW don't think in the same way, I guess. And
who knows, I could even buy an ATW some day. As an ST user I'm quite
satisfied with the development of the Atari ST-line happening now.

> BobR

Well, if I was a boss, I could choose Atari IF it had all the programs etc. my company needs and IF it had the best price/performance ratio. I certainly wouldn't reject it for that reason that Atari produces video games, as well. (But I'm not a boss and I doubt I'll ever be...)

Jouni Alkio

2306. GEMDOS Extended Argument Spec (LONG)

Newsgroup: comp.sys.atari.st
Date: 1989-11-01 19:18:30 UTC
From: kbad@atari.UUCP
Message-ID: <1763@atari.UUCP>
Source record: 247576

GEMDOS EXTENDED ARGUMENT (ARGV) SPECIFICATION

Introduction

The Pexec() function of GEMDOS allows a program to pass to a child process a command line up to 125 characters long, with arguments separated by spaces. No provision is made in GEMDOS for the child to know its own name. This makes it difficult for C programs to correctly fill in argv[0], the standard place where a C program finds the command which invoked it. Because the command line arguments are separated by spaces, it is difficult to pass an argument with an embedded space. This document will specify a method of passing arguments which allows arbitrary argument length, embedded spaces, and support for argv[0].

Standard Argument Passing

The Pexec Cookbook specifies how to use Pexec() to launch a child process, passing a command tail (argument string) and an environment. Before getting into the extended argument scheme, let's review how arguments are normally passed to a child.

A parent process builds a command line into an argument string - a null terminated string whose first byte contains the length of the rest of the string - and its address is passed as one of the arguments to Pexec(). GEMDOS copies this argument string to the basepage which it creates for the child. Thus the parent is responsible for gathering all the child's arguments into one string. This is normally handled by a library exec() function. The child is responsible for parsing the string of space-separated arguments back into an array of strings. This parsing is normally handled by the child's startup code.

Evolution

Several methods of bypassing the limits imposed by Pexec() have been used by GEMDOS programs. Some allow a user to specify a file on the command line which contains the rest of the arguments. Others get a pointer to the arguments, or the arguments themselves, from the environment string. Most MS-DOS programs use a command file for the extra arguments. This can be inconvenient for a user, cluttering the file system with command files, and making the operation of batch files and makefiles more confusing.

Several "standards" have arisen on the ST which use the environment to pass arguments. While more convenient than command files, these standards have other problems. Some rely on sharing memory between parent and child processes. Some take advantage of undocumented features of the operating system to get argv[0]. Others give the

child process no way to validate that the arguments it finds are intended for it.

Rationale

In order to pass more than the standard 125 characters worth of arguments to a child, or to let the child find its name, the parent must place the extra information in a place where the child can access it safely and legally. The most convenient place is in the child's environment string. An environment string is a series of null-terminated strings of the format "VARIABLE=value" (e.g. PATH=c:\bin,c:\etc, or ShellP=YES). The last null-terminated string in the environment is followed by a zero byte, thus two consecutive nulls indicates the end of the environment. The environment is allocated for the child by GEMDOS, it is owned by the child, and its contents can be specified by the parent.

The child must have some way of knowing that the arguments which it finds in its environment are intended for it. The child may have been invoked by a parent which does not conform to this specification. Such a parent would leave _its_ arguments in the environment, and could pass that environment on to the child. The child would mistakenly interpret its parent's arguments as its own.

Placing arguments in the environment passed to the child gets around all of the command line limits of the standard Pexec() command tail. Because there is no limit on the length of the environment, arbitrary length arguments are supported. Arguments placed in the environment are null terminated, so they may contain spaces. A parent can also place the name of the command with which it invokes the child in the child's environment, providing support for argv[0]. Validation of the extended arguments can be placed in the standard Pexec() command line, by assigning a special meaning to an invalid length byte.

The GEMDOS Extended Argument Specification

This specification uses the convention that the presence of an environment variable named ARGV (all upper case) indicates that extended arguments are being passed to the child in its environment. This means that ARGV is a "boolean" environment variable. For the purpose of this specification, its value is not significant, but its presence indicates that the strings following it are the arguments for the child. Implementations of this specification are free to give the ARGV environment variable any value. The ARGV environment variable must be the last one in the environment passed to the child, so that the child can truncate its environment at that point, and treat everything before the ARGV as environment, and everything after it as arguments.

The first argument to the child (argv[0]) is the first string in the environment after the ARGV variable. This argument is the "pathname" parameter passed by the parent to Pexec(). The remaining arguments are those that the child would normally find in the command tail in its

basepage. Even if all of the arguments would normally fit in a child's command tail, the parent should set up the arguments in the environment to take advantage of the benefits of this extended argument scheme.

As many arguments as will fit in the command tail will be passed there as well as in the environment, to support non-conforming programs. As a flag that arguments are also in the environment, the length byte of the command tail will be 127 (hex 7f). Non-conforming programs should not have a problem with this length byte, because it is longer than the maximum 125 bytes allowed by Pexec().

As an aside, the Pexec Cookbook erroneously implies that a command line can be 126 or 127 characters long. In fact, GEMDOS only copies to the child's basepage up to 125 bytes, or until it encounters a null, from the argument string passed to Pexec(). It ignores the length byte, placing a null at the same place it found one or at the 126th byte if no null is found. This has several implications: the length byte is not validated by GEMDOS (necessitating validation in the child's startup code, but also making this extended argument spec possible), and the null terminator _can_ be located after the end of the real command tail (the Desktop places a CR character after the command tail and before the null). The ARGSTART.S startup code listing below demonstrates how to correctly validate and parse a GEMDOS command tail.

A child which finds an ARGV environment variable can use the command tail length byte value of 127 to validate that the arguments following the variable are valid, and not just left over from a non-conforming parent which left its own ARGV arguments in the environment.

Because the strings in the environment following an ARGV variable are not environment variables, a child should truncate its own environment at the ARGV variable by changing the 'A' to a null.

Implementation: Parental Responsibilities

To pass arguments in the environment, a parent must create an environment string for the child. This can be achieved by first allocating as much space as is used in the parent's own environment, plus enough room for the ARGV variable and the arguments to the child, and then copying the parent's environment to the newly allocated area. Next, the ARGV variable must be appended, since it must be the last variable in the child's environment string. Following the ARGV variable is the null-terminated pathname of the child as passed to Pexec(), then the null-terminated arguments to the child, followed by a final null byte indicating the end of the environment.

After setting up the arguments in the environment, the parent must place as many arguments as it can fit in the command tail it passes to Pexec(). This way, a child which does not conform to this specification can still get arguments from the command tail in its basepage. When placing arguments in the environment, the parent must set the first (length) byte of the command tail to 127 (hex 7f),

validating the arguments in the environment.

Here is an example execv() library routine in C. It uses three local utility routines, e_strlen(), e_strcpy(), and str0cpy() for getting environment size and copying strings into the environment created for the child.

```
/* EXECV.C - example execv() library routine
* ================================================================
* 890910 kbad
*/

long Malloc( long nbytes );
long Pexec( short mode, char *filename, char *tail, char *env );
long Mfree( void *address );

/* Return the total length of the characters and null terminators in
* an array of strings.
* `strings' is an array of pointers to strings, with a null pointer
* as the last element.
*/
static long
e_strlen( char *strings[] )
{
char *pstring;
long length = 0;

while( *strings != 0 ) { /* Until reaching null pointer, */
pstring = *strings++; /* get a string pointer, */
do { /* find the length of this string, */
++length; /* using do-while to count the */
} while( *pstring++ != 0 ); /* null terminator. */
}
return length; /* Return total length of all strings */
}

/* Copy a string, including the null terminator, and return a pointer
* to the end of the destination string.
*/
static char *
str0cpy( char *dest, char *source )
{
do { /* use do-while to include null terminator */
*dest++ = *source;
} while( *source++ != 0 );
return dest;
}

/* Copy an array of strings into an environment string, and return a pointer
* to the end of the environment string.
* `strings' is an array of pointers to strings with a null pointer
* as the last element.
```

```
* `envstring' points to the environment string.
*/
static char *
e_strcpy( char *envstring, char *strings[] )
{
while( *strings != 0 ) {
envstring = str0cpy( envstring, *strings );
++strings;
}
return envstring; /* Return end of environment string */
}

/* Run a program, passing it arguments according to the
* GEMDOS Extended Argument Spec.
*

```

Implementation: Prenatal Responsibilities

A program's startup code must handle getting extended arguments out of the environment. The startup code should get the basepage pointer off the stack, then get the environment pointer from the basepage, and search the environment for "ARGV=". If "ARGV=" is found, the command line length byte in the basepage is checked. If the command line length byte is 127, then the arguments in the environment are valid. The first argument begins after the first null following the "ARGV=". It is important not to assume that the null follows immediately after the "ARGV=", because some implementations may assign a value to the ARGV environment variable. After setting up an array of pointers to the arguments, the startup code should set the 'A' of the "ARGV" variable to null, thus separating the environment from the argument strings (remember: a double null terminates the environment).

Here is some example C startup code which shows how a child could look for arguments in its environment:

```
* ARGSTART.S - example C startup code
* using GEMDOS Extended Argument Specification
* ============================================================
```

```

sub.l (sp),d0 ; (argc+1) * sizeof( char * )
asr.l #2,d0 ; argc+1
subq #1,d0 ; argc
move d0,-(sp)
jsr _main ; call mainline
lea 14(sp),sp ; pop args
```

A Final Note

This specification was formulated with careful deliberation, and with input from several companies and developers who have created development tools for GEMDOS. The Mark Williams extended argument passing scheme was the main influence for this specification, because it has been in use, and supported by Mark Williams and other companies for several years. This specification is very similar to the Mark Williams scheme, with the following important exceptions:

1) Under the specification, the arguments after the ARGV environment variable may be validated by checking the command tail length byte. The Mark Williams execve() library function uses the command tail length byte as a telltale, but it is not checked by the crts0 startup code. This validation is important for the reasons mentioned in the Rationale section above.

2) The specification allows the ARGV environment variable to take on any value. Mark Williams uses the value of ARGV as an iovector, which is described in the Mark Williams documentation. The iovector should no longer be needed, as its primary purpose was to simplify the MWC implementation of the C library function isatty().

3) Some versions of the MWC startup code do not require the ARGV= to have an `='. Because ARGV is an actual environment variable in the specification, the equals character is required.

2307. Am I a DA? (long)

Newsgroup: comp.sys.atari.st
Date: 1989-11-01 19:51:32 UTC
From: kbad@atari.UUCP
Message-ID: <1764@atari.UUCP>
Source record: 247577

Several people have asked me recently how to write a program so that it could be used as both a desk accessory and as a program. The problem is not too hard, but requires some mucking about with the startup code of the program - if you're not willing or able to do that, then you needn't read any further...

Still with me?

Okay, the key to identifying whether your code is running as a DA or a program is the parent basepage pointer in the basepage. If the longword in the basepage at offset 36 (0x24) - which points to the basepage of whatever launched your code - is NULL (0), then your code is running as a DA. The problem is that a DA does not get a pointer to its basepage on the stack like an application does. In fact, a DA's registers (including the stack pointer!) contain garbage on startup, which is the reason that a DA must set up its own stack straight away.

The startup code provided with some compilers includes code which checks whether the parent basepage pointer is null or not. This code usually gets around the aforementioned problem of locating the basepage by taking advantage of the way the system normally loads DAs and programs. The TPA (Transient Program Area, i.e. text, data, BSS, and stack/heap) of a program or DA is normally contiguous with its basepage in memory. All the startup code has to do is look back 256 bytes from the start of the text segment, which is the first part of the TPA, and voila! There's the basepage.

The operative word here is "normally." It is not entirely safe to assume that your program's basepage is contiguous with its TPA, because it is possible for a program to set up a non-contiguous basepage and TPA by using the more arcane Pexec() modes. If you must assume that the basepage and TPA of your program are contiguous, then your startup code should validate that the basepage it is using points to a contiguous basepage and TPA. If the basepage and TPA are contiguous, then the longword located 256 bytes before the text segment will point to itself, since the first longword of the basepage points to the base of the TPA. Ideally, you should even go a step further, and check the text base address. The third longword in that basepage should match your startup code's base address.

There is an alternative method which is not used by any startup code of which I am aware. This method will allow the same code to run as a program or as a DA, and will also allow it to run with a non-contiguous basepage and TPA. It also takes advantage of the way the system "normally" does things, but we can guarantee that the system will always do things this way.

I mentioned before that a DA's registers are garbage on startup, well, that's not entirely true. When the DA gets control, register A0 always points to its basepage. When a program is started by a GEMDOS Pexec(), register A0 is always cleared. Using this fact, it is possible to implement startup code which gets the basepage address from register A0 if the code is launched as a DA, or at 4(sp) if the code is launched by Pexec(). Since it knows how it was launched, it can also do the stack setup required of a DA, otherwise it can use the stack pointer it gets.

I strongly recommend that startup code implementors use the latter method of DA/program startup. It allows far more flexibility in Pexec implementations, it works just as well as the "text base minus 256" method, and it is supported by Atari.

A proposal has been made to the local Atari users group in my area, JACG, hook up their BBS with "National Atari Echo". The current sysop is not familiar with this, (how to get connected, hardware/software required, fees etc.), so I thought I could help him by getting some info from the rest of you.

Please reply to me directly. And if there's enough interest I'll summarize to the net.

Thanks,
Marcelino Bernardo

Well, that's the answer then. The MEga lacks "profit potential"> I wondered
why no cards are being marketed for the Mega ST.

> The TT comes with most of what you'd ordinarily put into slots. Serial I/O.
> High-performance video. A place to plug RAM SIMMs.

Ethernet controller?? Nope.
Tape backup controller?? Nope.
Internal high speed modem?? Nope.

You see there are lots of potential internal addons for the TT.

>
> The marketing trade-off is this: the average user don't need 5 cards. If

> lacked so many features that you needed a bunch of cards.

That's my point:
You can't just go out and buy the more expensive Atari computer.
Because Atari introduces a new computer every two years, and if you don't
like it you are stuck. You can't enhance it and you can't buy a more powerful
computer. So, you are stuck.

Well, people saw, and touched the Atari CD-ROM drive years ago, and everybody
would agree that it is VaporWare.

People saw and touched the 1400XL 6 years ago (back in the old 8 bit days) and
everybody would agree that it is VaporWare.

Atari has a long history of VaporWare. Remember the ST that was going to use
the 68020 cpu?? It never came out either.

And all of the products mentioned here are just being shown as prototypes,
not production runs!! So, they too are VaporWare. Maybe when Atari starts
SELLING products they we can change them from VaporWare to HardWare.

And as far as selling them in Europe, they are still VaporWare here in the
United States. I understand that Atari has been selling IBM PC clones in
Germany for some time now. But now here in the States. So, those machines
are VaporWare to me.

But, maybe I should fly to Germany to buy an Atari computer??
With all of the US dealers dropping Atari it may not be long before
you have to fly to Germany to buy an Atari computer!!

I still say that a product that can't be purchased MONTHS or YEARS after
it was announced is VAPORWARE. And the STacy, the Lynx,the 1040STE, and the

TT/P are all 100% VaporWare!!

Or do you know where I can buy one of them today??

Rich Covert

2311. Games only for the ST?

Newsgroup: comp.sys.atari.st
Date: 1989-11-01 21:54:44 UTC

achowe@tiger.waterloo.edu (anthony howe) writes:

| So the problem is that both versions of zoo will not generate sound
| archives under TOS 1.4 - 89.4.6 for some reason. Yet under the developer
| release of TOS 1.4 - 88.8.8 everything is hunky-dorey.

It is possible that it is due to Zoo mishandling DTA management.
GEMDOS DTA handling (in the internal* part of the DTA) was changed,
possibly in the time between the developer release and the final TOS
release. Another problem is that GEMDOS _uses_ the DTA differently
in the final Rainbow TOS version than previous TOS versions... to wit:
if you don't save out DTA information between Fsfirst/next calls, when
the last call fails (with file not found), the DTA _will_ contain
garbage.

Or maybe it's just bad fairies in your computer.

As you know, games are the worst offenders in terms of doing things
which aren't portable and defeat our efforts at compatible upgrades.
The fact is, it is NON-game software which you can expect to work, and
games which are more likely to fail. (As it happens, a number of games
DON'T fail, notably Air Warrior on GEnie and SubLogic's FS2(!).
SideWinder also works, and it *does* get its work done in one frame.

(And now for the standard disclaimer before people rag on me about
things I didn't say...) Don't take this as a comprehensive list of
what works and what doesn't. It's just some games which I happen to
know work.

As far as I know, you'll be able to fit quite a lot RAM inside the TT.
Atari has said it will offer the ATW's good graphics board for the TT.
And I wouldn't really wonder if somebody introduced a some kind of slot
expansion for the TT.

2318. Naive Question : ST & IBM Disk Compatibility

Newsgroup: comp.sys.atari.st
Date: 1989-11-01 23:26:45 UTC
From: ladasky@codon3.berkeley.edu
Message-ID: <1989Nov1.232645.9023@agate.berkeley.edu>
Source record: 247588

I have a program for my ST that writes PostScript files, but my only
access to a laser printer is through this here UN*X computer account. I did
a ten-page project last semester, transferring each page by modem. It was
painfully slow, and when I found errors in the printouts, I had to go back
to square one.

My local ST retailer told me that Atari disks were compatible with
3.5" IBM drives. He gave me a program called FSFORMAT which initializes the
disk in a format that is readable by both TOS and MS-DOS... or so he said.
I was able to see that it woked on two systems that he had set up in his store,
but when I went to the PC on campus that is hooked in to the network, it
wouldn't read it!

Now there's a new PS/2 lab on campus which is hooked in to the net.
Does anyone know if this is a workable solution to my problem? Furhtermore,
does anyone know of specific PC/XT/AT/OS2 configurations which will NOT read
ST disks?

Thanks in advance.

Spectre GCR allows you to pop a MAC disk into the ST drive and emulate
a real MAC. MAC and ST format disks are *very* different, when you use
GCR you are always in MAC mode - not ST mode. If you put an ST disk in
a MAC you will get nothing. If your asking whether you can DL a file
(MAC file) to an ST disk and then run it under GCR, the answer is no.
Niether would you be able to DL an ST program to a MAC disk and run it
on an ST. There IS a program included with Specter GCR called TRANSVERTER
which does allow you to move files between the two different disk formats
however.

>Would someone on the net please repost information about HyperScreen?
>Thanks in advance.

I pulled this off the net a while ago. Unfortunately, I seem to have forgotten who wrote it. Oh well. The software patch to go along with this exists on terminator and (I think) panarthea. Enjoy.

==========
Several people have asked me to expand on the circuitry from "ST-magazin" to allow an expanded ST screen. The trick is this: a composite signal is generated by ANDing together the HSynch and Vsynch signals and supplying this signal to the MMU and Shifter chips instead of the normal DE (display enable) signal from the GLUE chip. Note that the original DE signal must still be passed on to the Timer B interrupt (pin 20) of the MFP68901. Additionally, a switch is used to enable either the new DE signal or the original signal to be used, allowing normal operation to be resumed when desired.

So, to describe the circuitry: the heart is an NPN transistor, type BC555 or equivalent. They give a BC237 as an equivalent; offhand I don't know what 2N series would be equivalent -- perhaps someone with access to a D.A.T.A. handbook can comment. Next are two resistors: a 240 Ohm emitter resistor to ground, and a 10K pullup on the base to +5 V. The collector is also connected to +5, so it's essentially a common-emitter circuit; a 100 nF capacitor from collector to ground takes care of the switching transients. Finally two diodes, 1N4148, are also connected to the base, with their cathodes going to HSynch and Vsynch respectively. Thus when either synch signal is low, the base is pulled low via a diode and the transistor switches off giving a low signal at the emitter; when both are high, the base is pulled high by the 10K resistor and the transistor switches on, pulling the emitter high to ~4.4 V.

As for the actual connections, the original was built in a 520 STM where the synch and +5 signals were conveniently located together at the modulator. Here +5, HSynch and VSynch are pins 7, 5, and 4 resp. For older 520s +5 is on pin 6 instead of 7. My internals book gives H and V synch signals at pins 37 and 38 of the GLUE chip, but there's a comment that the signal should be taken from the modulator input connections even when it is not installed. There's also a comment that a Version D 1040ST sometimes has too weak a synch signal to properly drive the transistor circuit, and I think it says you have to buffer the signals through two 7404 inverter gates (but it might be saying that these gates already exist -- I had to quit my German classes just when we were learning "werden").

That takes care of the inputs; the output from the transistor emitter is taken to one side of a SPDT switch, while the original DE signal from the

GLUE chip (pin 39) goes to the other. Now, the PC trace for DE is cut so that the it still goes to the timer chip but not the MMU and Shifter chips; the common pin of the switch is connected somewhere on the MMU/Shifter side of the cut. The three wires to the switch have to be long enough to allow the switch to be mounted in some convenient location on the case of the ST -- personally I'd prefer something a little more complex using DC switching so that the signals weren't taken over such a long route (nearly 12 inches judging from the photographs). The original was also constructed in a "fliegenden Aufbau", i.e. suspended in mid-air by the component leads, and wrapped in insulating tape. I would suggest a bit of perf-board or something so that a neater and more stable construction can be made.

There's also a comment that you might have to remove C114 in a version D 1040ST, I think to get a better risetime ("Flankensteilheit"); this capacitor is at the upper left of the shifter shield (? "Shifter-Abschirmgehauese").

As for the software, I'm still baulking at typing in 2900 bytes of hex-dump, plus I'm not sure of the legality of posting it to the net. However, the introduction states that when a substitute DE signal has been arranged "then compute-time intensive synchronisation tricks are unneccesary and a modified TOS or BIGSCREEN (ST-Magazin 11/88 edition) runs with the new Hyper-Screen resolution under GEM". Keith at UH Atari Computer Enthusiasts (uace0@uhnix2.uh.edu) informs me that he has already modified the BIGSCREEN code to suit, and is waiting on this detailed circuit description. I trust that he will make the code available once it has been tested. By the way, it is supposed to work in all resolutions: 420x284x16 colours in Lo-rez, 840x284x4 colours in Med-rez and 840x568 in monochrome Hi-rez. I hope this has answered all the questions...

TOS 1.6 is essentially TOS 1.4 with the support for the new features of
the STE. It does give the same new functions as TOS 1.4. They are NOT
two different versions of the TOS 1.2 "enhancement."

2324. sm124 flyback problems

Newsgroup: comp.sys.atari.st
Date: 1989-11-02 02:10:00 UTC
From: DETECTOR@TRIUMFER.BITNET
Message-ID: <8911020803.AA14907@ucbvax.Berkeley.EDU>
Source record: 247596

Has anyone had any problems with sm124 monitors dying due to flyback problems? We have had a flurry of deaths recently, around 6 or 8% of our 100 or so units on site. Most of these had manufacturing dates around New Year '88. I've scanned our archive of this mailing and found only two references to this, neither recent. We generally have our 1040's running 24 hours a day, so if this is a bad batch problem, it may take a while to show up on less exercised systems. I'd be interested in any feedback about monitor lifetimes, as we are debating the virtue of modding a more rugged monitor such as little Panasonic general purpose units (assuming this is possible) which typically last around 10 years at 24 hrs a day. Thanx.

SCSI.

>Internal high speed modem?? Nope.

Why internal? Get it on RS232 and then it doesn't have to be VME or TT
specific.

>You see there are lots of potential internal addons for the TT.

Yes, things like D/A boards. But many conventional type devices ought
NOT go in an internal slot, especially when you can take a product and
sell it for the Mac *AND* ST *AND* TT because it interfaces to SCSI.

You can continue to loudly claim that you have the right answers. But you
have no proof, and you make little sense.

Good idea. I've got BSD 4.3 source here (Tahoe) that I plan to get running
on this NeXT at some point. (It's called MACH, but whatever it is the NeXT
runs, it's *too slow*... And it doesn't come with sources. What an utter
drag.) Will probably try the same for the TT whenever it's available...

How do you download from the Vax - using Kermit? I presume you're setting
binary filetype when you ftp, so that's not the problem. However, if you're
using Vax-Kermit, also known as Kermit-32, you should "set filetype fixed"
on the Vax, not "binary" - but still use binary on the ST Kermit...

>_VERY_ useful, espesially if it can handle environment variables.

Sozobon C works perfectly well with Un*x-style shells, such as Gulam, tsh,
etc. I use jShell, which perhaps John Stanley will someday quit making
perfect and post. :-)

But I suppose you're looking for a GEM shell for Sozobon C.

I worked on one for a month or two. A number of factors stopped me:

* I'm not good enough at programming to make a "gee-whiz"
graphic compiler shell -- something like Think C on the Macintosh.
This is a hobby. I don't do this for a living.

* I got involved in other projects, namely some Usenet netnews
software.

* I didn't find it useful.

The last point is probably the most important. I really didn't see much
use for GEM in the write-compile-link-test cycle. Working from a command
line is a lot more convenient. I'd rather type "cc fubar.c" than
point-click-point-click-point-click-point-click-knock-over-my-coffee-cup.

If you disagree, I'd like to hear why. What do you expect to get out of a
compiler shell? What sort of user interface do you envision? I might be
persuaded to dredge up my SeeShell code and start hacking at it again.

Or maybe you'll be inspired to write your own.

>that other manufacturers now sell.

How many faster processors did IBM make since the second (8 MHz) AT?
How many accelerators for the PC are availeble from IBM, how many memory
upgrades?

Atari did not document the hardware, so few third-party hardworkers bit
the bullet and worked out, how it works themselves.

The second mistake is the ST pricing: it's to cheap to be taken serious.
Atari made games. My brother uses to play with an 2600 game system
dayly, just as lot's of sons of "managers" did.

2334. Atari ST multi-tasking/user operating systems

Newsgroup: comp.sys.atari.st
Date: 1989-11-02 11:11:38 UTC
From: gng@spocom.UUCP
Message-ID: <11@spocom.UUCP>
Source record: 247504

I'm compiling a survey about Atari ST multitasking/user operating systems.
If you use such an OS, please help me by just answering these questions:

1) What is the name of the OS and the latest version of it?

2) Is this OS multitasking, multiuser, or both?

3) What is the minimal ST hardware (and software if necessary) configuration
for this OS and if possible, the usual/best configuration for it?

4) Who is the manufacturer of this OS, and how can they be contacted?
(address, phone, uucp, etc)

5) How much does it cost (at the present time if possible)?

6) How long have you been using this OS?

7) On a rating of zero to ten, how Unix compatible is this OS?
(An explanation following it would be nice too)

8) What strengths prevail in this OS (if possible, compared to others also)?

9) What weaknesses are noticeable in this OS?

10) Other comments about this OS, the makers of it, etc?

Please send replies to me by email, and I'll post a summary here when I get a
sufficient number of replies. Thanks very much.

Watch out for using a 'switch'- or 'if-else'-statement for checking out your events, because it's possible that GEM gives you more than one event at a time (?!)k. I don't know exactly when this will happen, so I'll have to check one of my GEM-programs to see when and where this problem may occur. The only thing I can remember at this moment is that I noticed an incomplete update and that it was solved by using something like:

```
if (event & X)
...
if (event & Y)
...

etc...
```

With X and Y being MU_* or WM_*.

2337. 1st word to postscript converter ?

Newsgroup: comp.sys.atari.st
Date: 1989-11-02 13:21:00 UTC
From: PHFRESAR@CNEDCU51.BITNET
Message-ID: <8911060804.AA19658@ucbvax.Berkeley.EDU>
Source record: 247507

I have two specific questions to ask:

1) Does anybody tried to use the 1st word-plus to postscript converter 1STW2PS from the terminator archives? It works fine with the supplied example on a Mega-ST2, but I am unable to make it print graphics. I obtain a postscript file containing nuls in place of the apropriate postscript graphics commands. I tried to contact by E-mail the author, but I got no answer so far. So if somebody have succeeded in printing graphics, could he/she send me his/her example.

2) I wonder if there is a simple vectorized drawing program for the ST which produces Postscript output, so I can print it on a postscript Laser printer at work with high resolution. Since I am using Knuth TeX program for text and mathematical formulae, I find very frustrating to insert graphics in low resolution mode. I am interested to know what you guys who (or their institution) owns a postscript Laser printer are doing.

Thanks in advance to all replies.

Flash is GEM-based? Right. Yeah, sure, you can summon up the menu bar -- as long as you don't mind losing your terminal emulation screen while you do so. Flash is a refugee from the IBM PC world of user interfaces, not a real GEM program. You want a GEM terminal emulation program? Get ST-Talk Pro. It's cheap, and it's a real GEM program.

Disclaimer: I don't have any connection w/the ST-Talk people; I just get disgusted with programmers who throw in a single menu bar or some cutesy dialog boxes and think that they have written a GEM program. Give me a break.

In article <46950eee.14a1f@force.UUCP>,
covertr@force.UUCP (Richard E. Covert) writes ...

>Well, people saw, and touched the Atari CD-ROM drive years ago, and everybody
>would agree that it is VaporWare.

I believe I saw a disagreement about that within the last week. Maybe it
was vapor, too.

>People saw and touched the 1400XL 6 years ago (back in the old 8 bit days) and
>everybody would agree that it is VaporWare.

Yeah, I'm really upset about that. I'm also angry that Ford won't sell me
an Edsel. Those corporate buzzards! What's happening to civilization,
anyway? Next thing you know, they'll take Gunsmoke and Bonanza off TV. At
least we still have Lawrence Welk. What? What do you mean, he's ....

>Atari has a long history of VaporWare. Remember the ST that was going to use
>the 68020 cpu?? It never came out either.

That's the real reason I bought my ST -- because I read some half-baked
rumor in an Atari magazine based on an offhand comment from an Atari
executive that they were working on a bigger/faster/better ST that would
make mine obsolete. (Sheesh!)

>But, maybe I should fly to Germany to buy an Atari computer??
>With all of the US dealers dropping Atari it may not be long before
>you have to fly to Germany to buy an Atari computer!!

All of the U.S. dealers are dropping Atari? Now, there's a Weekly World
News cover for you:

IT'S A VAPOR CAPER!
PHANTOM ATARI DEALERS
SPOTTED ACROSS AMERICA
*
"My Dealer is Alive,"
Elvis tells reporter
*
Roseanne Barr's
love child gets Lynx
for Christmas
*
Space alien types
on tiny computer
no bigger than a
videotape

*
Two-headed computer
invades shopping mall;
"I'm a Viking,"
one proclaims

>I still say that a product that can't be purchased MONTHS or YEARS after
>it was announced is VAPORWARE. And the STacy, the Lynx,the 1040STE, and the
>TT/P are all 100% VaporWare!!

The STacy is overdue, but I don't think I'm going to pee all over myself
because of it. I have not seen any announcement from Atari of the U.S.
availability of the STE or the TT (MegaStation). They'll be here when
they're here. Go take a valium, or study Zen, or something.

>Or do you know where I can buy one of them today??

Yeah. The Lynx is available. This is from Fidonet:

|From: Joseph Muha
|To: Joseph Muha Msg #201, 28-Oct-89 10:37am
|Subject: LYNX
|
|Norm, I called the Sears 800 number, they were clueless for a while, but then
|the put me through to Chicago and BOOM, they called me back in 5 minutes (no
|lie) and I placed my order. The LYNX is on SALE right now, listing at $159.00
|I got mine for $147.50 and it will be here in 10 days!@ Thank you , thank you,
|1000 times, THANK YOU. Also, the cartridges are on sale too. I ordered
|Gauntlet III, but that is on BACK ORDER. The catalog number for the LYNX from
|Sears is 49 TD 75425. You can call from their many 800 numbers or the local
|store as long as you have the catalog number. Again Norm, thanks, you just
|made my Christmas!!!!! ;-)

>but when I went to the PC on campus that is hooked in to the network, it
>wouldn't read it!

DCFROMAT will also make a ST floppy useable on a PC. Don't use folders on the disk as this causes problems sometimes. If formatting on the ST doesn't work try formatting it on the PC (format for DD not HD, ie: 726kb not 1.44mb or whatever the exact # is) and then put it in the ST to copy the files onto.

I've had luck using DCFORMAT on the ST, writting the files on a Tandy PC, then reading the files on the ST. Some combinations work for some people other combinations for other people (or machines). The best you can do is try a few different things and hope one way eventualy works for you.

Good luck,

>Dlibs and Gemfast have been written for a 16 bit compiler.
>I have a version of Dlibs that I adapted for use with GCC.
>It has been modified for 32 bit integers.

This reminds me of something I've been wondering about for a while.
Why does GCC on the ST have 32 bit ints?
Surely 16 is the obvious size considering it has 16 bit memory access.
(Note that I don't consider
"so that badly written code will still work ok"
as a valid reason.)

Every time anything accesses an int in CGG, it requires two memory
accesses. Most programs are full of things like "++i" or "i+=7"
or "if(i>j)", and such things take approximately 100% longer when
ints are 32 bits.

Even worse, take a look at the source for functions that interface
with the OS. Typically the function has a loop that takes the 32-bit
ints from the stack and moves them to 16-bit words and then invokes
the system trap with a pointer to this list.
Surely it would be many times faster with 16-bit ints,
since the function could simply pass a pointer to the stack arguments
without having to do any of the moves and resizing.

Has anyone made a 16-bit GCC and library and done a comparison?

2343. PageStream 1.80

Newsgroup: comp.sys.atari.st
Date: 1989-11-02 18:08:52 UTC
From: covertr@force.UUCP

Source record: 247513

PageStream 1.80 for The ST Ships!!

I have owned Soft-logik's products since the original Publishing Partner was released back in 1987. I still use PP 1.03 instead of Page Stream as I was never satisfied with the reliability of PgS 1.5.

Well, I don't have PgS 1.80 yet, but I did get a real nice package in the US Mail from Soft-Logik. The package was 70 page, small-manual sized newsletter titled "Soft-Logik Review Vol. II, No. 1". I was surprised to receive the newsletter as I haven't heard anythin from SL in six months. I had tried PgS 1.5 was decided that Calamus 1.09 was better. So, I stopped reading GEnie messages, and talking to SL.

The newsletter is very nicely organized with an attractive cover page, a Table Of Contents, six appendices, and an index. The newsletter is designed to slip into your PgS manual binder, which is a nice touch.

The newsletter describes the new features in PgS 1.80, how to order it, and the SL BBS.

The next chapter (section) describes two new features, irregular text runaround and Rotation.

There is a chapter on PostScript printing, and a new Beginners Tutorial. the Beginners Tutorial shows how to install the PgS software, and gives a sample personalized letterhead and document.

The newsletter ends with two chapters on additional products for PgS. One chapter covers fonts and other SL products.

The last chapter is probably the best part of this newsletter. It is a collection of third party fonts, cliparts, and PgS designs. There are samples of many of the fonts and some of the clip art. So, you can view the fonts before purchasing them. SL has even included ads for text special effects produced with PgS. One ad is for business cards prepared by Roland Steele in duncacville Texas.

All in all, I am impressed by this newsletter. I especially liked the third party ads which show the support that Soft-logik provides third party vendors. It is enough to encourage someone to develop PgS fonts or docs and submit them to SL.

I congratulate Soft-Logik on a fine newsletter. I will submit a review of PgS 1.80 once I get my update from SL. I sent them a check (only $10 for this update!!) today.

For the time being, any time you swap disk, be sure to either press the
ESC key or click on the top shaded bar of the item selector before
saving/reading to the new floppy. This forces a directory update of the
newly-inserted disk and will be a nice work-around until you can get to
a hardware solution.

Somebody wrote:

> My main point is that having ONLY one slot guarantees that no vendor will
> design hardware for that slot.

Remember (as has been pointed out before) no vendor HAS to design
hardware specifically for that slot: it's already been done. That's
why we chose a standard bus interface.

You are also overlooking the fact that the first TT, internally
designated the TT/P, is the low-cost base model. It has one VME slot
(not full size, either). The larger, more expandable model will have
more than one (I don't know the number) and they'll be full size.

There is also the possiblity, but don't hold me to this, that you can
connect a VME card-cage to that one slot, and get as many slots that
way as you want. Such a cage would have to have its own power supply,
and the connecting cable would have to be short and well-shielded (or
crosstalk and Old Man FCC will get you) but I don't think there are any
impossibilities there. I don't know for sure that it's possible,
though: I'm not a VME guy.

OK, just tell me about these Mega cards?? The oNLY one I can buy, off the shelf is for the Moniterm 19" monochrome monitor. And, if Atari still haves them, just maybe a Math Coprocessor Mega card. But, my dealer doesn't stock the Math Coprocessor card, so I don't know about it for sure.

Please, tell me about all of those Mega cards!!

>
> >Internal high speed modem?? Nope.
>
> Why internal? Get it on RS232 and then it doesn't have to be VME or TT

Because internal IBM modem cards are cheaper then external modems. Just price them yourself. So, an internal modem for the TT should be cheaper then an external modem. As far as resale value goes, a used modem is only worth 50% of retail at best. And even less as faster modems are introduced.

>
> >You see there are lots of potential internal addons for the TT.

>
> ------
> Greg Lindahl
> gl8f@virginia.edu I'm not the NRA.

Furthermore, wouldn't it be nice for Atari to sell a truly open system and let the Marketplace decide what to add to it. I place a lot more faith in third party vendor then I do in Atari!! So, if the TT Tower EVER comes out, which I have very serious doubts about, I might consider another Atari computer. But the TT Plastic

is just another closed, limited support, game machine to me.

P.S. Do you know why Atari Corp doesn't just quit pretending to be
a SERIOUS computer vendor and go back to making Game Machines??
Could it be because of the Atari Stock Prospectus filed with the
USA SEC?? which says that Atari will make COMPUTERS?? If Atari
stopped pretending to make computers and concentrated on making
GAME MACHINES, they make commit fraud?? Actually, the TT
sounds like one hell of a GOOD Game Machine!! IT should be
marketted as such!!!

********** GOOD NEWS SECTION **********
Craig Daymon wrote an excellent ShareWare program called MANUAL MAKER.
MM is used to print out hlaf-page sized manuals, on double sided printouts.
MM has macros which allow for bold, italic,underlinging, footers,
and headers. It is GDOS, but given good GDOS fonts you can make
excellent printouts. MM prints out all even pages and allows you
to re-feed the sheets to print the odd pages on the back side.
MM has some canned cover sheets you can use. Unfortunately, MM
doesn't allow you to include graphics. but, Craig has indicated
that with the proper encouragement (shareware $$) he could add
such. Craig asks $15 for MM. Please connect Craig on GEnie. I will
post his name and address here if asked. All in all, Manual Maker
is execellent for printing out small manuals.

I sincerely hope that you have better luck with the Postal Inspector than
I did (read that as *NO* help at all!). I got stung by Hippo for an
EPROM programmer that never did work. They ended up with the programmer
and about $200 of my cash, and the Postal Inspector was of *ABSOLUTELY*
no help. We exchanged correspondence for about 6-8 months (with some
up close and personal interactions as well), and that was enough time
for Hippo to be totally gone, with no hope to recover any of my losses.

I do suspect, however, that you may have slightly better luck getting
your ounce (I guess I should say pound ;-)) of flesh from CMI, since
they still sell in the Amiga market as well (unless they've really
gone belly up).

In article <30975@watmath.waterloo.edu> rbutterworth@watmath.waterloo.edu (Ray Butterworth) writes:

>Has anyone made a 16-bit GCC and library and done a comparison?

You can always use this simple hack:

#define int short

But you have to be careful with constants. If you pass 3 as an argument to a routine expecting a 16 bit integer, it will pass 00 00 00 03 instead of 00 03. To get around that, pass your constants as (short)3 instead.

Of course if you haven't written your program yet, just write stuff to use shorts instead of ints.

Source record: 247527

Recently, i did a few benchmarks on two Megas. Programs: quikdex1.0 and
ICD's ratehd. Systems:

a) ST2, TurboST1.6, NO blitter installed, SH205 (Tandon 262 (at 1:1
interleave, i think)).
Partitions: 2.4/6/6/6 MB.
TOS 1.2, Turbodos 1.5, AHDI 1.7.

b) ST4, TurboST1.6, blitter, Seagate ST296 at 1:2, Supra host.
Hypercache Board --- 16 MHz 68000, 8k cache.
Partitions: 21.2/21.2/21.3/21.3 MB formatted with Supra Software
(i.e. long FATS)
TOS 1.4, CACHE90, AHDI 3.01

Both Systems:
ACC's: TurboST, Control, HP-Calculator.
SM124.
Atari's 68881 Board

Results (average of 10 ICD-tests):
a)
CPU: 99 %
BIOS-text: 343 %
GEM draw: 338 %
GEMDOS i/o: 1561 %
DMA-read: 2254 %
Data rate: 262 +29 -20 kB/s
Access: 121 +- 3 ms

b) Cache off, TurboSt + Blitter
CPU: 100 %
BIOS-text: 346 %
GEM draw: 349 %
GEMDOS i/o: 1279 % (large FAT's!)
DMA-read: 3367 %
Data rate: 407 +- 0 kB/s
Access: 31 +- 1 ms

b) Cache on, TurboSt + Blitter
CPU: 180 %
BIOS-text: 500 %
GEM draw: 409 %
GEMDOS i/o: 1370 %
DMA-read: 3367 %
Data rate, Access: see above

The FPU has not been tested by these Benchmarks.

Effect of caching:
Compilation speedup is typically 1.4 times (Laser C, GNU C, Absoft Fortran)
Most FPU floating point operations are speeded up 1.5 times (large
overhead of communication between 68000 and 68881). Real programs
with much floating point and large address space (0.5 - 2.8 MB for variables)
which call the '881 from library routines run 1.5 times faster. Software
floating point ops are speeded up 1.85 times typically. In most cases,
an 8MHz ST with '881 performs fp faster than the Hypercache machine
without '881.

Michael Ritzert

mjr@dmzrzu71.bitnet

BTW: In my opinion, 30$ shareware fee for a simple benchmark program
like quikdex is quite expensive. The authors should think of putting
this program into the PD as ICD did with ratehd. (Only for comparison
--- in Germany you have to pay the equivalent to 30$ for the ultra fast
shareware TeX! The Author translated this TeX manually from Pascal to
Turbo C.)

2356. Calamus PD and Shareware fonts

Newsgroup: comp.sys.atari.st
Date: 1989-11-02 22:07:54 UTC

Message-ID: <89Nov2.171348est.57671@ugw.utcs.utoronto.ca>
Source record: 247528

Since I mentioned that there were over 50 PD and shareware Calamus fonts already available, I've been swamped with requests for more information. I called ISD, and they're working hard on Outline, so do not write to them for copies of the PD fonts. The official source of Calamus support software, including PD fonts, is Genie in the Atari Library (p.476). Call up menu #8 and go into library #30, which is the ISD customer support library.

I am not on Genie, and I do not use PD fonts (we have almost half of the CG fonts now), so I cannot help. Could someone please start posting the PD fonts to the net? There is a lot of interest.

I have the following Atari ST software packages w/manuals for sale:
(I will pay the shipping)

Gridiron!: The Football Simulator $15
GFA Championship Basketball: Two-on-Two $10
Leader Board: Pro Golf Simulator $15
w/Tournament Disk #1
Rogue $10
Phantasie III: The Wrath of Nikademus $12
Roadwar Europa $12
Roadwar 2000 $12
Colonial Conquest $12
Gauntlet $12
The ChessMaster 2000 $15
Breach $10
Dungeon Master $18
Carrier Command $12
Gunship $12
Jet $12
Flight Simulator II $15
w/Scenery Disk 7
Starglider $12
Harrier Strike Mission $10
The Music Studio $20
PC Ditto I $25
(or all for $225)

The following magazines w/disk:
Compute!'s Atari ST
February 1987 Volume 2, No 1, Issue 3 $3
April 1987 Volume 2, No 2, Issue 4 $3
June 1987 Volume 2, No 3, Issue 5 $3
August 1987 Volume 2, No 4, Issue 6 $3
October 1987 Volume 2, No 5, Issue 7 $3
December 1987 Volume 2, No 6, Issue 8 $3
February 1988 Volume 3, No 1, Issue 9 $3
April 1988 Volume 3, No 2, Issue 10 $3
(or all for $20)
STart: The ST Quarterly
Spring 1987 Volume 1, No 4 $3
Spring 1987 Volume 2, No 1 $3
Fall 1987 Volume 2, No 2 $3
Winter 1987 Volume 2, No 3 $3
Spring 1988 Volume 2, No 4 $3

(or all for $12)

2360. Spectre GCR Drive speed

Newsgroup: comp.sys.atari.st
Date: 1989-11-02 23:35:01 UTC
From: 2FHDBEAK@kuhub.cc.ukans.edu
Message-ID: <16727@kuhub.cc.ukans.edu>
Source record: 247532

I have a question for all the Happy Users of the Spectre GCR.

I know from experience with the old Spectre that it was significantly faster than a Mac Plus when doing drive I/O to native Spectre/Magic Sac disks.

Is this speed lost when the new GCR reads/writes to Mac GCR disks, or is it the same or faster than a Mac?

Thanks,
Jim Sisul

>This reminds me of something I've been wondering about for a while.
>Why does GCC on the ST have 32 bit ints?

For compatibility - using the 32 bit int mode, I can take just about any source file off a Sun, Usenet (comp.sources.unix), etc., type "cc" or "make" and have a running executable without ever having to edit a single source file.

>Surely 16 is the obvious size considering it has 16 bit memory access.

Yep. So obvious, in fact, that every version of ST GCC that's been posted has been sent out with *both* 16 *and* 32 bit libraries. What are you complaining about?
>
>Has anyone made a 16-bit GCC and library and done a comparison?

Look again, if it's not there, whoever gave you your copy has done you and the FSF a disservice. You can also get the latest gcc stuff off of terminator if it's really missing.

As an offhand comparison, ARC is about 20% faster with the 16 bit library. Unfortunately, the stdio stuff seems really slow, dunno if that's just my bad luck/bad configuring...

Maybe the REAL problem is people who take rumors and run with them. Or reporters who take sightings at research labs and trun them into the newest and hottest items, due out 'real soon'. Mr Covert AGAIN takes the vaporware concept and runs with it. To me, vaporware means items which are talked about and promised but which do NOT exist in hardware or pre-production form. I have *SEEN AND USED* a real honest to goodness STacy. If STacy never sees the light of day it will not be vaporware my friend, just like GCR was NEVER vaporware. Just because people whine and complain about not being able to buy hardware just announced a few months ago does NOT mean that a company somehow is miraculously able to ship thousands out units overnight. Things take time, tooling up takes time, FCC approval takes time.

>worth 50% of retail at best. And even less as faster modems are introduced.

An IBM-PC card bus is not a VME bus. VME cards are much more expensive to
make. An internal VME modem card would end up costing over a thousand
dollars, I'd guess.

And as someone else touched on, you won't have to wait for TT-specific
VME cards. VME is a standard that's been around for years, and you can
already buy lots of VME products, from D/A converters to memory to high-
speed I/O controllers to video cards to multiple serial-port boards to...
But they don't come cheap, unfortunately.

>
>Because internal IBM modem cards are cheaper then external modems. Just
>price them yourself.

I have. The trade-off is that you pay more for the computer in the first
place (slots cost money) to maybe save money down the road. By the way,
VME slots are a lot more expensive to build than a PC-BUS slot, so I'd be
amazed if anyone ever made an internal VME modem card. Why don't you find
one and tell us how much it costs?

A VME slot isn't like a PC-BUS slot. It's faster and more expensive. You
put quite different things in them.

> Furthermore, wouldn't it be nice for Atari to sell a truly open
> system and let the Marketplace decide what to add to it.

They've announced one. Why don't you sit back and see if it materializes?
They also have a corporate philosophy that the average user doesn't
need a truly open system. If you don't like that philosophy, go found
a competing company and quit bitching here.

By the way, I'm typing this on a Sun 3/80. It has room for SIMM memory,
a SCSI port, and serial ports. It's a little less expandable than the
TT/P....

> But the TT Plastic
>is just another closed, limited support, game machine to me.

Much like the Sun 3/80, eh? Wow, great games.

>P.S. Do you know why Atari Corp doesn't just quit pretending to be
>a SERIOUS computer vendor and go back to making Game Machines??

Because Atari makes a lot more money selling computers than it does
selling game machines. Read their annual report. With a few facts
to back up your postings, they might become educational.

Hi there. I'm trying to write a C application for the ST that copies a raster block from a 32K buffer to the screen. According to the Laser C documentation, all I need is:

```
MFDB *source, *dest;
:
[MFDB's are assigned]
:
a_copyraster (source, dest);
```

Problem is, I can't get it to work. I've verified that my MFDBs are set up properly (they work fine with vro_cpyfm()). I've tried setting the various line-a variables, to no effect. I'm out of ideas, and I need help.

If anyone knows how to get this to work, I'd appreciate you writing a reply, either by e-mail or by post. An actual example would be especially welcome. Thanks for your time and patience.

>You see there are lots of potential internal addons for the TT.
>

The TT already has a SCSI port. Why would you need a tape backup controller?
With the proper software, you could hang an Exabyte or a RDAT off the port.
What more, in terms of tape backup, can you ask for?

Also, what good is an internal modem? I know no one who has a high speed
internal modem. Every high speed modem that I've seen is external.
(Including the Dual Standard I'm using to call this system.)

Besides, who wants to spend $700 (or whatever amount) for a high speed modem
that will only work on one machine?

>
>That's my point:

>Richard Covert

You can't enhance an Atari computer? Am I hearing this from the mouth of
someone has a Turbo-16 upgrade inside his Mega? Or the Spectre GCR
emulator? Or whatever else you might have inside that Mega?

Why can't you buy a new computer if Atari comes out with one? What is
preventing you from doing just that?

I'd llike to use a Percom 5 1/4" DS/DD disk drive (designed for Atari 8-bit computers) to transfer IBM 5 1/4" disks to 3 1/2" for use with PC Ditto. Can this be done? If so, does anyone know where I can get a cable to hook up the Percom drive to my ST?

Thanks in advancroger

2376. Re: laser printer vs. hard drive

Newsgroup: comp.sys.atari.st
Date: 1989-11-03 12:28:53 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <1487@syma.sussex.ac.uk>
Source record: 247546

Thanks to Richard Covert, Ian Powell & co. for their tips on how to maintain access to disk drives without having the SLM804 laser printer switched fully on.

We have a slightly different problem concerning the printer and the hard drive. We have two 'desktop publishing' setups featuring Mega 4, SH205 20mb Atari hard drive and laser printer. One was bought in Spring 88, the other the following Autumn. The first is connected as per the manual, i.e. the DMA connection runs CPU->Printer Controller-> Hard Disk. I works OK, usually, and we have few problems with autobooting using the Atari software supplied at the time (SH204DVR.SYS is installed on drive C:).

The second configuration, however, does not work when connected this way. The hard disk is not recognised. However, when we connect it differently, i.e. CPU->Hard Disk->Printer Controller, it works. At least, it works some of the time, for we often have difficulty at boot-up time, when the system decides it wants to boot up from the floppy.

I suspect this is due to timing problems in the DMA channel, and would like to be able to reconnect the system in the 'proper' way. But how can I get it to recognise the existence of the hard disk if I do? I now have a copy of HDX v3.01 (sent by a friend in America - I assume there would be no problems using it on a UK setup), so does anyone think that reformatting the hard disk with it would solve the problem?

When the SLM804 came out, the UK magazine ST World reviewed the same desktop publishing setup that we have, and they too found that they had to connect the peripherals in the same non-standard manner, so I'm relatively confident that we didn't do anything drastically wrong (or different from the first setup) when we installed the second configuration. Does anyone have information that could help, or at least explain the puzzle?

Thanks,

Graham

One of the first i486 machines has been produced by Apricot systems, here
in Ontario (Mississauga, to be exact). It is a server with all sorts of
neat-o security devices, 6 SCSI ports ect, ect. (I'll leave a description
to the dedicated news group). Anyways, you can also get some i486 tabletops
too, and they are pretty interesting also. ALL come with MS-DOS 4.1. Oh Boy!
Hold me back! I can't wait to buy one so I can go out and drop another wad
of bucks on AT&T Sys V. Richard, haven't you heard the one that goes:
"The grass is always greener,...."

2379. Memory upgrade affects performance?

Newsgroup: comp.sys.atari.st
Date: 1989-11-03 14:47:03 UTC
From: dmk@cbnewsi.ATT.COM
Message-ID: <1184@cbnewsi.ATT.COM>
Source record: 247548

Hello all,

I just upgraded my 1985 vintage 520ST to 2.5 Meg of
memory and I've noted some system performance differences
that make me wonder if I've done the upgrade correctly.

First let me say that I've run a number of memory diagnostic
programs and all seems fine. TOS recognizes the added memory
and the memory seems to be working.

The thing I don't understand is that the computer takes at least
4 times as long to boot (possibly longer). Is TOS running some
kind of memory test, or is it just zeroing out RAM? Even worse,
once that system is up and running, it takes a lot longer for
applications to load and run. Is the system slowed down by the
dynamic RAM refresh cycle? I thought that the MMU handles that?

The one thing that I noticed is that if I configure and install a
large RAM disk (~1.5 Meg) the loading and running of applications
goes much faster.

Any ideas on what's going on?

Thanks in advance.

dan

I do it all the time. Reading is no problem, writing will be slower on the
GCR due to the Mac II's skewing scheme.

>We all know that both the TT and the STE will run ST software,
>but will the TT run STE software ?

The TT will not be able to run STE software that makes use of the STE's horizontal scrolling feature...
Any software that doesn't need this, and uses either the extended color pallette (1 more bit R, G, and B) and/or DMA sound should work just fine.

>Will the STE run some STE software (i guess not) ?

Yes, STE specific software is going to be developed.

>What I'm aiming at is: Will TT-user have the possibility of using programs
>made for the STE (if the great TT user want to a game :-)

In some cases, yes, in some cases, no.
Say, for example, you've got a new STE Paint program, why then of course (as long as it doesn't scroll horizontally using hardware) you can use it, and the 4096 colors, on the TT! Problem with games is that they'll _probably_ use the horizontal scroll...

>(Note that I don't consider
> "so that badly written code will still work ok"
> as a valid reason.)

[problems associated with 32 bit ints deleted]

This isn't a flame, just a reminder:

If you want 16 bit ints, you must declare short ints.

If you want 32 bit ints, you must declare long ints.

If you just declare int, the size is implementation dependent.

You're right that a 16 bit int makes more sense in a 16 bit architecture,
but DO NOT depend on all compilers to do it that way!

GCC is supposed to be portable over a wide range of machines, many of
which are 32 bit. Perhaps this is why GCC ST has 32 bit ints.

2383. Docs, gem, gdos, fonts and printer driver

Newsgroup: comp.sys.atari.st
Date: 1989-11-03 16:04:23 UTC
From: chang@cme.nbs.gov
Message-ID: <1899@puertorico.cme.nbs.gov>
Source record: 247418

Hi, I'm the thus far happy owner of a 1040ST for two weeks
now.

Now that I've spent a bit of time familiarizing myself with
the machine, I'd like to start writing programs for it. I'd like to
know if there is any documentation, hopefully PD for the following.

1) Gem. Yes, I'd like to write a fairly gem intensive
program. I'm thinking of using sozobon or gcc. I'm a fairly
experienced X11 programmer, so I don't think this should be a
difficult task, I just need some reference guide.

2) Gdos. Been hearing this and that about it on this group.
I don't really know what it is or how I can get it. My aforementioned
program will want to print various non-standard characters (say
chinese). And from what I've read about it, GDOS seems to be a good
thing to deal with such. I see some gdos related stuff on some of the
archives, but unfortunately there's no detailed list of what all the
things are.

3) Fonts and printer driver. Well, I'd like to create,
convert some asian character fonts and be able to support them on a
printer. The aforementioned program does exist for X, I'm hoping to
port it, and I'd like to support this.

Could anyone mail me info on any of these topics, or at least
suggest source code of existing PD programs, of which I can look to as
examples.

Many thanx.

Forrest

P.S. Please......

In article <23589@cup.portal.com>, Xorg@cup.portal.com (Peter Ted Szymonik) writes:
> on an ST. There IS a program included with Specter GCR called TRANSVERTER
> which does allow you to move files between the two different disk formats
> however.
> Peter Szymonik
> Xorg@cup.portal.com

As far as I know Transveter 4.50 (TV450) does not allow transfer from a
Mac HFS floppy or hard disk partition. So, to get your Mac files from
Mac to ST you need to either create a Mac MFS floppy, or a Mac MFS hard
disk partition. That is in addition to the Mac HFS partition, which is
required to run MOST new Mac programs.

So, the Mac has two totally different file systems.

Makes the ST's standard DOS-like file system look great!!

Now, if Dave Small & Co. would just modify TV450 so that it can
xfer between Mac HFS floppies and hard disk partitions to ST Spectre
would be really useful.

An example of when you need a Mac MFS parition is if you need
to xfer a Mac file that is bigger then 800K. 800K is the size of a
Mac MFS floppy. If the Mac file on the Mac HFS hard disk partition is
llarger then 800K then it won't fit on a Mac MFS floppy. So, you need two
types of Mac hard disk partitions. One for HFS and one for MFS. And you
use the MFS to xfer files back to the ST world using TV450.

Mac has to make everything more complicated!!
I wish that TV450 could xfer between Mac HFS and ST, then you wouldn't
need a Mac MFS hard disk partition, or Mac MFS floppies.

so, PLEASE Dave or Dan ADD that feature to TV450!!!

> ||| Atari R&D System Software Engine
> / | \ #include <disclaimer>

Ken, I use Mark Williams C version 3.09 (mwc). Will MWC have to be changed
to support the new TOS 1.4?? From the above message it seems that the
programmer just needs to restore the DTA after the last call. It doesn't
seem to impact AES/VDI libraries, or am I mistaken??

If I was a developer would I get this kind of info earlier??
I am thinking about applying 'cause of some Forem Utilities that I
want to market as ShareWare.

> ||| Atari R&D System Software Engine
> / | \ #include <disclaimer>

Ken, I have made this comment on GEnie, but briefly I think that the
TT could be a killer machine if two things are done:

1) It must be an OPEN system with plenty of card slots for third party vendor
addons. This is really an important feature for an expensive workstation
class machine.

2) It must have AT&T System V Release 4.0 UNIX with X Windows. AT&T has
publicly announced binary compatibility between all Sys V Rel 4 UNIX
on the same cpu. So, with X Windows you have a common platform to develop
applications for many different machines. This means that the TT Tower
could run programs from Sun or maybe even Apple.

I have heard rumors that Atari is going to buy some strange non-AT&T UNIX
type OS w/o X Windows. I hope that this is NOT true because UNIX/X Windows
could blast Atari into the 1990s!! Especially if the TT/Tower is cheaper
then a Sun or an Apple Mac A/UX system. so, please tell your folks at the
shop that AT&T UNIX (and the new one Rel 4) with X Windows is mandatory for
the TT/Tower.

I personally couldn't care less what you put on the TT/Plastic as I don't
plan to buy another Atari computer w/o plenty of card slots. And the TT/Tower
with its 5 full VME card slots looks good to me. so, produce the TT/Tower
with UNIX/X Windows and you will have a killer machine. Produce anything less
and you have a Game Machine!!

> A3000 a vaporware product too.

In one sense, any product that hasn't been released can be called "vaporware"; at least, that's the sense that's been used around here.

> Seems odd that they aren't crying about their awful - supportless -
> lying - cheating C= company like they are trying to accuse Atari of, eh?

Commodore-Amiga has been shipping a 68020 based machine for almost a year and we have a A2500-based 68030 machine practically out the door (eg, in production). That's not the A3000 yet, but it does demonstrate that much of what Commodore shows does actually ship. It may not ship as soon as you like, it never ships as soon as I'd like, but it does ship. And there's been quite a bit of support and on-going development on the software side.

I'm not here to bash anyone. But I do recall the way things worked here, say, about 6 years ago. I hope things never got like that at Atari. And you have to look at who's doing the bashing for you can judge it. There's always one or two who bash anything a particular company does or doesn't do -- you see 'em here, in the Amiga, Mac, NeXT, and probably groups I don't read as well. When you start to see a large variety of folks making similar complaints, something real may be wrong.

I think the obvious product here is a buss-repeater card and an external vme cage. Should be doable - apart from the usual FCC problems - and cheap enough to be viable for people who need more than 1 extra card. Personally, I would have thought two slots to be a better design than just one, but perhaps this is a form factor problem (also pronounced 'styling' or 'marketing' :^P)?

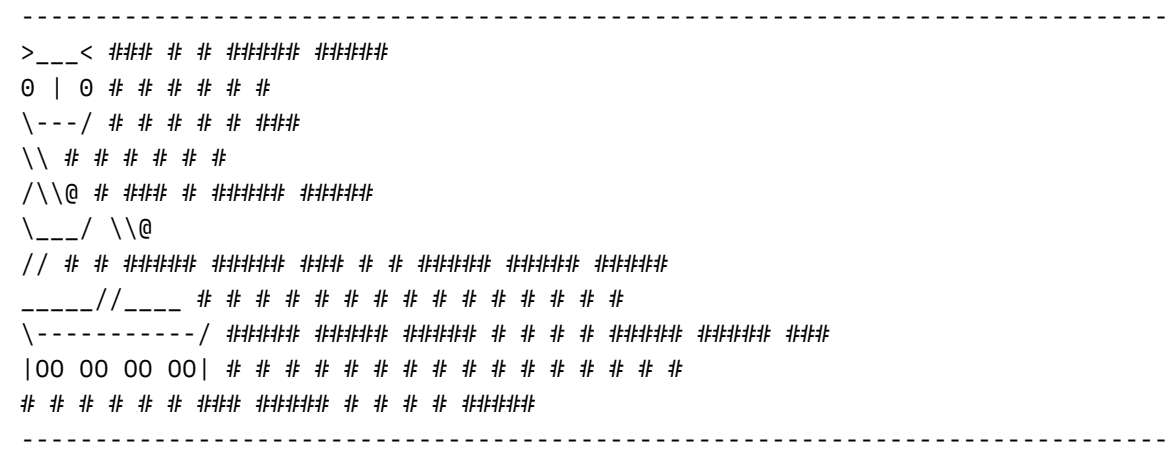
Every time you run a program the ST writes zeros to all unused memory (and does it slowly at that). So when you go from 512kb to 2.5kb starting up a program becomes signifantly longer. The reason booting takes longer is probably because you have programs in your auto folder which get run when you boot and the same memory zeroing happens with these programs as well (I'm not sure if this applies for desk accessories).



The solution is to get one of the programs which work around (fix?) this problem. The one I use which seems to work very well is called PINHEAD.
I have a 1040ST with only 1 meg of ram and pinhead still makes a very noticeable difference in booting (all those auto programs to enhance the ST starting up you know) and the normal running of programs.

>
>The thing I don't understand is that the computer takes at least
>4 times as long to boot (possibly longer). Is TOS running some

I just upgraded about a month ago and had the same problem. I believe TOS 1.2 does do a memory check after each load. I'm not sure exactly what it is doing but it is a bug, and TOS 1.4 is supposed to correct the problem. However, I have not upgraded to TOS 1.4 and still was able to correct the problem. How, you may ask? Well, there is a nifty shareware program by CodeHead software called "Pinhead". You place it in your AUTO folder, and **BAMM** things will be flying again. The latest version even fastloads itself, so there is hardly any noticable difference. If you would like a copy, let me know. I can e-mail it to you or post it here (if anyone else would like it).

Otherwise, how do you like being at 2.5 Meg? I don't know how I survived without it for so long!! :^)

This has been covered before ... what you are noticing is that when the system loads and runs an application, the first thing it does is clear all available memory from the end of the program and up. When there is only 512K of RAM to clear out, less your application and any DA or RAMdisk memory, this goes in a flash. Now that you have 2 Meg or so free to be cleared, it is noticable.

Some (poorly behaved) software relies on this memory space being zeroed out, some do not. For those that don't there are a couple of PD programs which will tell TOS not to clear RAM on invocation. This means things will launch much quicker (especially with 2-4 Meg of RAM), but also that some things will not function well at all. Check the archives near you for such a program.

Well, I'm not sure where you got this information. I just came
back from Switzerland and Germany. The TT is shipping there in
only *one* form - the desktop model. It is pretty much everything
that has been discussed on this newsgroup. The UNIX (tm) it
supports *is* Berkley Unix...it also supports X-Windows. In
addition, a special "TOS" window can be opened up to run
the now familiar TOS desktop. (I am not sure, however, that this TOS
window supports color ST programs...I saw no indication that it
did.)

It comes with an ethernet port, a *high* rez screen, etc etc etc...

If anyone wants, I'll translate the product review in
the November issue of 'St Magazin' (a german publication) and
post it.

Also, just to dispell any rumors: the ST is *huge* in Germany and
Switzerland. A head-to-head contender with the IBM and IBM clones.
As to the Mac? I only found it in one computer store as a "speciality"
order...and, this was amusing, the Mac had custom paint jobs! (You could
order orange with a racing stripe, for instance.)

In other words, there is a reason why the Atari ST is still around:
europe.

```
|As I said, I don't use Interlink but I have friends who swear by
|it. Maybe someone else can explain Interlink.
|
|Richard Covert
|----------
```

I have been using Interlink for about 3 months.

I give Interlink an "okay" rating. I bought Interlink because it is GEM based (didn't realize Flash was GEM based). But, the GEM interface is not well thought out in a couple of areas and so is a mixed blessing. (At least, the organization of the menus doesn't make too much sense _to_me_). It is hard to figure out where to find things in some cases. I end up using the function keys much of the time.

Other notes:

The learn mode works but you can't edit the resultant script (at least not officially). Maybe the file is editable, I haven't looked.

The manual is comprehensive but it is hard to find things (the index is not very complete). I learned alot about "telecommunications" from it, though. It bears several readings if you are new to modems and such.

The program has lots of esoteric (for me) features, so I doubt I'll need a program that does more. I would guess that most anyone can do what they want with this program.

The code seems fairly robust. I've had trouble with running programs during background downloads, and I had trouble when I set the fast bit. Otherwise, the code seems very solid.

The program came with a free Genie sign-up, so I effectively paid $5 for it.

Summary: I'd have a closer look at Flash if I were to do it again. But I intend to keep on using Interlink now that I have it. It does what I need and does it reliably. I may upgrade to Masterlink to gain scripting and improved background download capabilities though.

2399. What is Vaporware? (was: atari-bashing/vaporware)

Newsgroup: comp.sys.atari.st
Date: 1989-11-03 20:40:10 UTC
From: daveh@cbmvax.UUCP
Message-ID: <8409@cbmvax.UUCP>
Source record: 247427

>>I still say that a product that can't be purchased MONTHS or YEARS after
>>it was announced is VAPORWARE. And the STacy, the Lynx,the 1040STE, and the
>>TT/P are all 100% VaporWare!!

First of all, most folks get real confused about what constitutes a real announcement. Believe it or not, it's not what you read in the "rumors" column of your favorite computer rag. To pick a more netural territory, take for instance the Apple IIx that was mentioned here earlier. Apple never announced such a machine. Never. There were big-time rumors that Woz was working on such a beast a few years back, when in fact I think he was doing university stuff and really nothing for Apple at all. Then there were more rumors about how Apple axed the IIx and canned the whole II line, then shortly thereafter the IIgs emerged. Most likely, the IIx rumors were based on the IIgs project -- judging by the work that went into the IIgs, it wasn't exactly a slam-dunk project (carrying the architectural baggage necessary to remain compatible in these older machines usually means lots of otherwise unnecessary complexity). But you'll find boat loads of Apple fans who'll swear that the IIx was a real, announced product. At least 5% will even claim is was what the IIgs "should have been". Chances are, nothing even close to what they're raving about ever even existed.

It's not entirely the fault of the computer groupies, either. It used to be common practice (circa 1985 and earlier) to show stuff at consumer oriented shows that were basically trial balloons. These shows aren't for the public; they're the way vendor and distributer get together. A company would show a prototype, sometimes a barely functional prototype. And they wouldn't tell anyone that it wasn't complete. The idea was to attract vendors. If there was no interest, the project went no further. In many ways, this substituted for a lack of true market research.

Nowadays, I don't think anyone really does this, and I'm sure no one gets away with it. It just doesn't work when you're dealing with real computers instead of toy computers. That's not to say that no one every shows a product that never ships; of course they may. But they aren't doing it intentionally; products get cancelled for a variety of reasons: management changes, market changes, new technology, etc.

In the case of Atari, there are certainly some products there that aren't what I'd call Vaporware, even obvious to an outsider. Lynx, for instance, is a technology they acquired from a group at Epxy (former Amiga folks, I might add). The ATW was also an acquired technology. While there's often an element of NIH (Not Invented Here) in any such aquisition, a smart company doesn't by true vaporware, and they don't interfere with it too much once they buy it.

>>It has been modified for 32 bit integers.
>Why does GCC on the ST have 32 bit ints?

It also has 16-bit ints: use -mshort on the command line.

> "so that badly written code will still work ok"

I *do* consider this a valid reason. Personally, I consider "int" to
be an evil data type when the issue of portability comes up. But look
at UNIX and all the libraries meant to look like UNIX: malloc, fwrite,
etc. all take "int" arguments, because "int" is "big enough" on those
machines. A 16-bit library will probably work, but you can't malloc /
write more than 32K at a time. Thanks. MWC suffers from this, as does
Alcyon and some Mac-derived compilers (but for a different reason).

It's not pretty, but we're stuck with it. If you don't want it to be
slow, use "short." (Unless your compiler is REALLY bad, like MegaMax's
is or was, and "short" is *8* bits!)

Only part of the design process is the hardware. If the vendor doesn't see the TT as a large enough market, the customer will have to write the device drivers, which would be a major undertaking for the average TT owner.

A friend of mine, who hacks the atari, assures me that the atari
bios zeros the memory before it launches an application. This leads to
longer and longer delays before the program begins (as with booting).
When you boot, every desktop application will prompt this delay.
I have also upgraded my vintage '85 520st to 2.5megs. I assure you,
I expereince the same delay effects you do. This is 'normal', well...
normal for atari's brain-damaged bios.

[Rest Deleted]

You think $99 is expensive? Listen to this one:

Our local Atari "dealer" had difficulty getting TOS 1.4 because of the stupid rule Atari has/had that said they could only get as many sets of ROMS as they have desktop publishing systems. Since this "dealer" does not sell Megas, they couldn't get any. Our user group prez interceeded, and the dealer got some ROMS. At first, they said it would be $100, or $130 installed. When they got them, they returned the favor WE (as in our user group) did for THEM by raising the price to $110, or $140 installed. Correct me if I'm wrong, but that's the highest price in the country.

This dealer also got the new PageStream upgrade disks, but RETURNED them because they didn't want to be bothered with upgrading people's versions. Even getting them free from SoftLogic, and being able to charge what they want for the upgrade, they still don't want to do it. Doesn't seem to be much of a dealer anymore, eh?

By the way Atari, I'm talking about Software House in Rochester, NY. Maybe you aughta talk to them a little.....

Your suggestions are fine, but the easiest solution is to get the 16 bit libraries (and a version of the compiler that can handle them; anything later than 1.34, but I'd recommend getting 1.36). I routinely use -mshort with no problems (other than brain-damaged software that thinks sizeof(int) == sizeof(long); but the prototypes in the standard include files help a lot with even that).

The most up-to-date version of the libraries (both 16 and 32 bit) are available on dsrgsun.ces.cwru.edu, in ~ftp/atari. If you don't have these libraries, get them; thanks to some nice work by Dale Schumacher (dLibs), Henry Spencer (strings), Jwahar Bammi (lots of stuff), the people at Berkeley (curses and doprnt) and yours truly, they're a big improvement on the original GCC library.

Of course, this opens up a new "fourth party" market. Just as there are
HP laserjet, deskjet, and postscript GDOS drivers, if there's a large
enough market, an Atari developer will write and market a driver. This
developer might even sell the card as a value added package. At least,
he/she would not have to do hardware development to put out something
like a NetBIOS for the TT...

From: a55@mindlink.UUCP
Message-ID: <664@mindlink.UUCP>
Source record: 247415

Recently, on a friends IBM, he showed me the ultimate game/utility cheat program. During the game, by pressing a hot-key, a menu popped up that allowed him to do the following. He would look at the number of men he had in his game, say, 5. Then he would call up the editor and scan for 5. The program would tell him how many 5's it found. Then he would purposely kill his man, decreasing it to 4. Then by calling up the menu, he could enter 4 and the program would check for any variables that changed from 5 to 4. Then he could lock his men to any number he wanted. I am interested in the same type of program for the ST. Anyone out there that thinks it can be done? I think the hardest part is probably getting the game to pause while you enter those commands, then resume.

I think that you do not have to worry about startup code and the basepage to let a program find out how it is has been started (as application or DA). It is right that the startup code should do the right thing (mshrink or not), but there are startup codes available (e.g. APPACC.A) which ensure the correct startup in both cases. The other problem (find out the way the program is invoked) can be solved simply by using the AES-function shel_read, which returns a pointer to the string containing the program name (xxx.ACC or xxx.PRG) and a pointer to the parameter string. I have not yet tested this function (better look into the GEM-documentation about that) but when a program is started as a DA, either shel_read should return a pointer in addrout(.0.) or an error code (0) in intout(.0.). Message-ID: <46300056@uxf.cso.uiuc.edu>
Source record: 247438

I had the same problem with my 2 year old 1040. What I did is
open the case (after trying the same things you did...).

Turns out my disk drive was full of dust. I brushed it all
off, took the rectangle mech. out of the case and cleaned it.

Now everything works.

One other thing to watch for is placement of your monitor.

Atari's monitors emit an exorbitant emf field which can
royally @%#! over your drive's operation. i.e. if it is
placed anywhere over the drive..

I have seen a number of 16MHz cards mentioned. Has there been any
comparison among them? I know about the German accelerator card, but
that one has no space for math chip. Is there any well functioning card
with 8 or more kbytes of cache memory and math chip? I have heard about
Turbo16 - place for math chip? Price/where can I order it if so?
I am also slightly mystified that it should go faster with 100ns ROMs.
I thought it was 16MHz only for CPU and cache memory, going down to 8 MHz
externally. How does that work???

2421. Trying to read an Atari St Gem-Dos disk on a Mac SE using FD/HD

Newsgroup: comp.sys.atari.st
Date: 1989-11-05 01:20:52 UTC
From: pnh@pmin24.osf.org
Message-ID: <PNH.89Nov4202052@pmin24.osf.org>
Source record: 247443

Has anyone tried this? yes, I know about Spectrum and its successors
but I need to read ST disks and write them on the Mac, using the FD/HD.
I don't think it's possible w/ Apple File Exchange (I know it isn't, because
it recognizes the disks as MS/DOS, 720 K but can't read the directory
structure and only offers to format them) but it might be possible w/
MacTar or something--has anyone tried this?

2422. megamax

Newsgroup: comp.sys.atari.st
Date: 1989-11-05 02:56:18 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <1706@calvin.cs.mcgill.ca>
Source record: 247444

does megamax have an e-mail address I can send mail to from an internet account?
I sent some paper-mail to them but they haven't responded. It is very important!

2423. Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1989-11-05 09:21:55 UTC
From: Fred.Mah@p0.f30.n147.z1.FIDONET.ORG
Message-ID: <124.25553A2D@metnet.FIDONET.ORG>
Source record: 247445

To answer your question about Mac and Atari/Spectre GCR disk compatability I would have the following to say: Using Spectre GCR, the Atari will read SS/DD and DS/DD Mac disks but not high density so if you only put the info on double density disks there should be no problem.

2424. Re: Hard Drive RLL info... Good Deal?

Newsgroup: comp.sys.atari.st
Date: 1989-11-05 10:40:40 UTC
From: rjk752@uxf.cso.uiuc.edu
Message-ID: <46300058@uxf.cso.uiuc.edu>
Source record: 247446

I have a 50meg ICD Fast drive with a Host adapter. ICD has a nice
hard drive utilities package with cache that makes it the fastest hard drive
I've used. In response to your question, I'm very happy with it so far.
Your dealer may have been talking about an imbedded SCSI controller
vs. a separate SCSI controller and drive. The imbedded SCSI's are faster,
cheaper, and slightly more dependable. The separate SCSI's have the advantage
of being able to drive other hard drive mechanisms later on when they are
added tyour expandable case. With imbedded controllers, each add on
drive has to have an imbedded controller also. 40ms access time is very
good for a drive that isn't imbedded though, so I'm not sure if this is what
he means.
I got my hard drive from Joppa, and it was about $700. List
price for the FA.50.ST is $899. The 30meg lists for $800. All in all,
you seem to be getting a good deal from the distance I'm standing at.

2425. MODULA2.ZOO FROM ETH XBIOX QUESTION

Newsgroup: comp.sys.atari.st
Date: 1989-11-05 10:40:49 UTC
From: glk01126@uxa.cso.uiuc.edu
Message-ID: <111500051@uxa.cso.uiuc.edu>
Source record: 247447

Has anyone figured out why xbios.def in the def\gemlib folder
and xbios.def in the def\system folder are not identical?

Which one is correct? In the gemlib\ folder, there is not
an xbios.sbm/obm whereas there is one in the system folder...
Did I receive a partial implementation?

Thanks in advance...
-Spieu!

2426. Re: DOES ATARI LASER PRINTER WORK ONLY WITH MORE THAN 1 MEG RAM STs:

>
> DOES ATARI LASER PRINTER NEED MORE THAN 1 MEG RAM ?
> - - - - - - -

Yep. The SLM804 does not have local memory. It allocates parts of the ST's
memory to store images. This takes about 1Meg, as I know.
Where do you think are the bucks you save not buying a LaserJet ? :-)

>a hardware solution.

Er, as far as I know, this wouldn't help you so much because TOS doesn't recognize the media change if you have the hardware problem. Because the disk is only re-read only on media change, you'll get the data for updating the windows from memory. => no effect.
Workaround for pre-1.4 releases of TOS: toggle the write-protect status of your disk and insert it again. TOS then recognizes a media change and the ESC key will cause a re-read.
TOS 1.4 forces a media change every time you press ESC; this is a real fix to the problem.

Source record: 247452

koreth@panarthea.ebay.sun.com (Steven Grimm) writes:
>An IBM-PC card bus is not a VME bus.

Agreed.

>VME cards are much more expensive to make.

Why? The connectors? OK, but the connectors represent perhaps only 10%
of the manufacturing costs of an "interesting" card. The rest of the
technology is identical.

>An internal VME modem card would end up costing over a thousand
>dollars, I'd guess.

Don't think anyone plans to get rich selling them @ that price!
There would be no market.

>And as someone else touched on, you won't have to wait for TT-specific
>VME cards. VME is a standard that's been around for years, and you can
>already buy lots of VME products, from D/A converters to memory to high-
>speed I/O controllers to video cards to multiple serial-port boards to...
>But they don't come cheap, unfortunately.

I agree completely about that. But consider why: VME is currently an
industrial specialist market. If it became a consumer/business
market, the usual economies of scale and competitive market forces
would drive the prices down to affordable ranges in a pretty
deterministic fashion. It might take a year or three, but it would
happen, at least for the most popular boards (which would be modems,
clever video hacks, memory, ethernet, high performance disk
controllers, probably some other things that haven't been invented
yet...). The market just isn't big enough right now, and it's
fragmented because these cards are going into a large number of
dissimilar software environments. Given a unified market, things
would start to snowball (I sincerely wish).

gl8f@astsun8.astro.Virginia.EDU (Greg Lindahl) writes:
>A VME slot isn't like a PC-BUS slot. It's faster and more expensive. You
>put quite different things in them.

The buss is faster, agreed. But no law says that the _cards_ have to be faster. A modem, for instance, is inherently slow, so insert a few dozen wait states - who cares? Take your time about asserting VPA :-)

>By the way, I'm typing this on a Sun 3/80. It has room for SIMM memory,

>TT/P....
>> [Richard Covert] But the TT Plastic
>> is just another closed, limited support, game machine to me.
>Much like the Sun 3/80, eh? Wow, great games.

You neglect to mention the ethernet connector on the back of the 3/80, which excuses a multitude of sins. You also neglect to mention the slots in your server. This is being written on a DEC VS2000, an even more restricted machine than a 3/80 - but I use the peripherals in a heavily-slotted 3/160 and 11/785 all the time, transparently, over the ethernet. So IMHO, the vs2000 doesn't need the slots; it needs servers ;-). Servers are just what the average home user of a TT/<n> doesn't have access to.

BTW, the Sun has one other thing not available to the TT user: a _real_ OS. SysV doesn't cut it, and I can't really get too excited about any version of TOS/GEM. Along with a real OS, one gets a very nice environment for developement, or just getting work done. SunOS 4.x is a bit of a pig, tho - I'll take 3.5 any day ;^).

From: Imran Anwar <pitt!cunixd.cc.columbia.edu!ia4>

No the ST was bought from J&R, shipped to Pakistan where it stopped working after
only a week. Talk about American quality. Had to be brought back and repaired
but it ended up having a new ROM based TOS instead of the original Disk based
system.

I am here in the US since 1/89 and bought a 1040ST here...

The 1040ST is $569 and the color monitor $300 here.

Yes this is going out on my ST..... + ZOOM modem.

Regards

If I am not mistaken, the Atari ST is considered too "high tech" for export
to Soviet Bloc countries. I think any machine with the MC68000 falls into
this category, but I may be mistaken.

I use the ST mostly for Telecom right now. But as I get time I want to
get into programming it more. I know many languages... trying to use
Modula-2 more now. Pascal is nice. I don't like C. Use assemblers as needed.
Right now trying to learn GEM programming on the ST.

I don't get involved with Music, DTP, fancy color graphics.

I have a MEGA ST2 with MEGAFILE 30 and SH204 hard disks, Monomonitor, and
Supra 2400 modem. I also have a color monitor... but don't use it much.

OK, here is a reply.
I may in a state, but not a STATE, so I will tell you I am in
Waterloo, Ontario.

For the purposes of your survey you may use the following information:

This week I hear about a "special sale" at a nearby store
for members of its "Preferred Customer Club".

Computer
alone with monitor

520STfm C$ 399 C$ 799
1040STfm C$ 699 C$ 1099

These prices, in Canadian Dollars, are a little less than their
usual prices.

Permission:
You may use the information about the sale, and the name of the
city, but not any information that will identify me.

YOU WANT YOUR NAME POSTED WITH YOUR PRICE QUOTES???

Because things are not completely smooth between the owners of
the local shop and some of its customers. Unavoidable, I suppose
for anybody in business. There is no point in stirring things up.

Now, a question for you. Why do you type with all CAPS?
I generally avoid this, because some people interpret it as
"shouting".

****
Subj: Re: C A P S......as in typing with....

Thank you for doing the survey.
I will be interested to see the patterns that result.

****

2436. SURVEY!!! Europe/UK Replies !!!

Newsgroup: comp.sys.atari.st
Date: 1989-11-05 17:56:52 UTC
From: kar7481@cuphub.cup.edu
Message-ID: <1683@cuphub.cup.edu>
Source record: 247456

The following information was compiled in a series of price surveys on ATARI products in Europe.....You MIGHT wish to PRINT THIS OUT before reading it!!! (after all, it IS 910-lines long!)

Hope this puts some of YOU in contact with OTHER of YOU!!!

All replies are welcome, just send mail to me at "KAR7481@cuphub" with your "subject:" line stating "SURVEY--REVIEW/REPLY".

Thanx!

Sorry I can't remember what you were after in your original posting.
But if you want to know Atari prices from various countries I can
send you prices from Finland in a day or two when I get the latest
price catalog.

And what comes to Soviet-bloc: They are not connected yet.

> ATARI-UK, AND THIRD AND FINALLY (BUT STRANGELY ENOUGH) THE US!!!

Funny thing that you say so. But well I heard the day before yesterday
from Atari import people here in Finland that they are starting to sell
Stacy here in next month. I hope that this is not only sales scrap.
Anyway I got Finnish prices of them. Here they are.

Stacy in November -89
TT in the first od second quarter of -90 ? (bloody h*ll)
ATW (it is possible that I see this in next week)

FIM
Stacy 1104 (1M/720K) 11 000,-
Stacy 1125 (1M/20M) 13 240,-
Stacy 2146 (2M/40M) 17 800,-
Stacy 4147 (4M/40M) 21 200,-

> Hopefully, I will be able to keep in touch with you and others in the
> European ST community.

Yes. Hope so.

> Are you a member of any ST user groups or organizations???

No I'm a sort of independent 'hobbyist'. I have started with PC machines
over three years ago. Now I have AT. I bought Atari ST1040 last June. And
I have ordered both Spectres. Mac ROMs I have already. I have a firm with
two of mates and we happen to found a customer who is quite willing to
consider to buy Stacy especially if he can use it as portable Mac and PC.

> My organization here in the US is looking to swap/exchange info. and
> Public-Domain software (Share-ware too!)...

I keep here in University of Vaasa ftp'able directories of PD and ShareWare
software for PC and Mac. It is possible that I could start to keep also
Atari archive place... Now I take the programs from news-system but only
for myself.

Subj: SURVEY
From: pitt!ohdake.uta.fi!jackin (Markku M{enp{{)
Subject: SURVEY

Hi,

Here are the Finnish Prices. All prices in FIM (Finland Mark about
4.2 USD). Prices are recommended retail prices.

520 stfm 3790 :- (no monitor)
Mega ST 2 9000 :- "
Mega ST 4 12000 :- "

SM 124 900 :-
MegaFile 30 3900 :-
MegaFile 60 7000 :-

SLM 804 9950 :-

Portfolio 3950 :-

I called importer (Teknocomputer) and asked about stacey, TT, STE.
They said that if there is enough interest they will start importing
them. Person whom I talked with didn't sound very excited.

There is 20% discount automatically for students (not too bad, could be less).

If I recall correctly, Stacy is already selling in Norway. (Is this message
going to Norway anyway). I would like to have some addresses and prices, please.

Hope this helps,

jackin (Markku M{enp{{) in utacs (University of Tampere CS)

Subj: Re: I kinda figured FINLAND....
From: pitt!ohdake.uta.fi!jackin (Markku M{enp{{)

Nothing much I am afraid. The importer (TeknoComputer) does have a few
advertisements now and then, but they all advertise this gamescollection
'Superpack' or whatever. Nothing wrong with that (I love games), I just
wish that they would give promotion to the professional market now and
then. Of course we get new machines months after they have been annonced
(don't they all :-). No sign of Stacey/TT yet.Nor TOS 1.4.

It is somehow interesting when you read a computermagazine MikroBitti
which is only magazine for homecomputers and notice that the same
people who were using Commodore 64 and Spectravideo (MSX) years ago are
now using Amiga nad Atari ST (resp.). I used to have Spectravideo. And
the great battle goes on. (Not me, at least not often).

We have quite a few ST-clubs around the country (BBSs too). I haven't myself
joined any of them. I tend to get my software (both PD and commerc.) abroad.
I am seriously thinking of buying a TT. Maybe from West-Germany or England,
Norway is a possibility too. Seen any TTs lately ? Nah, guess not.

Where are you from anyway ? I'm not very good at guessing by path. USA ?
Canada ?

By the way, have you ever used Objectworks (programming enviroment for
Smalltalk-80). It should be availiable for Sun, Mac II, PC, ST (4 meg), etc..

Well got to rush, a lecture is about to start. (did I say rush :-)

! Markku ! (Want to hear how my name is pronaunced the finnish way,
that always gave me some chuckles in the USA, "Pardon")

Subj: Re: I kinda figured FINLAND....
From: pitt!ohdake.uta.fi!jackin (Markku M{enp{{)

Do you mean Scandinavian made programs etc. Or products availiable in
Scandinavia ? I know one dealer but they are dropping ST for good.
They feel that it does't make enough profit. But I can have their
product list. But there aren't many Scandinavian products there.

I have read about PITTSBURGH in a book from Kurt Vonnegut. But did
you say California. Oh boy, wanna trade universities ? I bet you
would love it here in winter (20 degr below 0 celsius, tons of snow :-).

! Markku !

P.S. Did I mention polarbears ?

|
| !!!
| (repost-1)
|
| ATTENTION!: Fellow ST users/programmers;
|
| ***************************************
| Looking for other U.S & European ST users who are members
| of ANY ST-related usergroups!!!!!
|
| * The Atari Elite ST Organization of Pittsburgh *
| is looking to establish contacts with
| other ST usergroups.
|
| Preferably via UUCP channels or F-net channels.
| --
| When responding, please include your location {CITY,STATE}
| in your "subject" header.
| --
| Possibilities include LIBRARY/NewsDisk(letter) swaps, etc......
Sorry, but i am not affiliated to any usergroup. I don't know of any
Atari usergroup here in France.

| Also, For my own personal survey, please answer the following questions.
| I am trying to compile a list of REGIONAL prices on:
|
| 1. 1040STf(m)'s [cpu only, color system,mono system]
| 2. Mega 2's " " " " " "
| 3. Mega 4's " " " " " "
|
Public prices in France:

1040 stfm: 4990 Fr (it is a bargain because of the new stE, before it was
at 5990 Fr.
1040 stfc: 5990 Fr
1040 stf : 3690 Fr

mega st1: 5490 Fr (without sm124)
mega st2m: 11300 Fr
mega st4m: 14900 Fr

sm124 (mono screen): 1000 -> 1490 Fr (true: in an ad from the same shop,
sm124 costs 1000F if bought with a 520, 1500 if bought with a 1040!!)
sc1224 (color screen): 2990Fr
520stec: 5490,
520stfc: 4490F

All prices include taxes (18.6%)

Hope this helps you.

Subj: Re: The STe .....

this a message about STE I have just sent to daniel@pkmab.se

Bye, Bertrand.

PS: If you see tos1.4 fix for rts/cts (and including: mouse doubler, screen saver)
could you e-mail me? Here we can't access to genie. Thank you.

Hello.
In the last issue of ST-magazine, a french magazine dedicated to ST (and now
also to others microcomputers, times are changing...),
there is a paper along with a photo about STe.
Chips are now square, no more DIL, and you can have 4 SIMMS mounted inside.
With 2 SIMM's (Single in line memory module) of 256 Kbits chips, you have
512KBytes, with 4x1Mbits you have 4 meg. It is not clear if the 4 sockets are in
520STE (money is money). New processor: a NS musical processor, i have not seen
the reference. 2 15-pin joystick ports, near the cartridge port. Genlock is
supported. It is a preview, so things may change.

Price is the same as old 520ST. 2 sockets ONLY for roms. Tos is 1.6. No bus
extension.

Regards.
Bertrand

From: pitt!dutrun.tudelft.nl!rcdsosw (Oswald Knoppers)
Organisation: Delft University of Technology, Delft The Netherlands.

As the 1040 is on its last days it is very cheap at the moment here in
Holland, less than 1500 guilders (about $ 730) inclusive a monochrome
monitor. The Mega 1 is about 500 guilders more expensive. Wouldn't know
how much the other Mega's currently cost.

CC:
Subj: Re: Borland's TURBO-C for the ATARI-ST...Exists???
Organisation: Delft University of Technology, Delft The Netherlands.
From: pitt!duttnph.tudelft.nl!robert (Robert de Vries)

Sure it exists, I use it for nearly a year now. It is based on the Turbo C
for the IBM PC, for what the parser is concerned. The code generation part
is done by Heimsoeth in Germany. At the Cebit fair in Germany they announced
version 1.1 including f68881 support, a source level debugger (december 1989)
a graphics library compatible with the PC version.

I think I've heard that they don't sell it in the USA. My own opinion about
the compiler is that it is fairly mature from the start, but a few small bugs
were in the first version. The optimizer is VERY good. The code is the fastest
from ALL ST compilers, including Mark Williams, Lattice, Laser, Gnu CC, etc.
I have used it to compile AIM (the Atari Image Manager) and I found two small
bugs in the code generation (which were easily circumvented) and one or two

bugs in the libraries, printf and realloc. printf handles floating point
numbers between 0 and 1 wrong. realloc is almost completely broken.
The codegeneration part for unsigned ints is also buggy. When adding an
unsigned int to a pointer it treats the unsigned int as if it were signed.
This goes well until 32767, after that complete disaster. Fix: use long ints.

Maybe this doesn't sound too great, and you may think I do not use this
compiler. The opposite is true. I use it all the time and I like it very
much.

Robert.

To: Dan Karbowsky;AtariEliteOfPghPa bbs412-384-5609 <kar7481@cuphub.cup.edu>

I am a student at the university in Oslo (the Capital of Norway) and live
20 min outside Oslo (almost in the countryside :-). When I'm not sitting
in front of a Sun3 and typing I'm calling from home using a norwegian
2400 baud modem (the worlds best - Unimod 4161 MNP3) and my MEGA ST4 with
MiniTerm (my own comm-program with everything, IBM graphics etc etc)

We have PC4 - although it's just a Mitac 286 with an Atari logo :-)
Norway does not have it's own Atari division but is a sub-division of
Atari Scandinavia in Sweden. This doesn't help much and we have one hell
og a time fighting our way to get some info from them !!!! Fools !!!!
Well... What more... Did you know that it exist a swedish and even a
norwegian version of TOS !!!???? (i've got the US TOS 1.4 anyway - data
language is and will always be english !!!!)....

If you want more info about me try this command:
finger larserio@ifi.uio.no

Hope I got it right, I live in a town called Orebro (O with two dots
on the top, you know?) in Sweden. Like the Subject:-header tells you...

I'm a member of several usergroups, but the one I'm speaking of is
the one I'm president of; HEXAGON. Soon we will connect to USENET
as well, we do have a Unix machine too.
We have STs and Amigas in our ug. And I think we've got a member or
two with Macintosh as well, but the ug hasn't got no mac.

All contact with us can be directed to me.

Everything is welcome. Just give me a hint by e-mail.

Nice idea, this! I just wished I had the time to manage the lot...
See you,
Daniel

> ESPECIALLY the "STacy" and "ST-E's".

Ok, I will in the near future. If they don't have any english versions
I'll translate them to you.
The STacy is avaiable, I think. I haven't heard anything, what so ever,
of the ST-E, not even rumours.

> Also, I need to know a few REPUTABLE Swedish ST dealers
> who will ship to the U.S.

That should be no problem. I'll check it all out next week or something
like that. I'll send an e-mail, and maybe a paper by snailmail as well,
'just to be sure'.

Oh... Not bad!
France is a very good country for the ST, as Germany. Here in Sweden
there are a lot more of these filthy Amigas than the ST's -- the '64
was very successfull here, 'back in the good old days'. And people tends
to keep their old company, for what reason I don't know.

Hope you can understand my english, I can't sometimes :-)

Be happy,
Daniel

[whistling sound] Not bad! The rrp for the Mega ST2 here is
10400 SEK, that is approx. $1700 {calculated with $1 == 6 SEK, it's
usually something like that}
I'm still waiting for the list from Atari Corp. Scandinavia, though!
They haven't got the faintest idea what service is, here...

>
> Most US ST dealers try to keep prices close to retail though.

Shops do like that here, too. But there're a lot of of other companies
here, selling only by phone. They're often 10%-20% below rrp.

Are there any STe's in the US yet?

[Error: Out of greetings],

Not even the PC3 ? Hmm..

> but I DON'T like getting screwed over like this.

> Should I move to somewhere in Scandinavia or what?????

No... You shouldn't -- you wouldn't probably be able to afford an
Atari if you lived here, there are TAXES, TAXES and TAXES and even
more taxes; And they (socialistic gov) intend to raise them again!

For example fuel for cars (gaz?): Now about $0.80-$1 (or something
like that) and the wan't to raise it to aprrox $1.30 !!! A litre!

>
>
> P.s; Do ALL Scandinavian women have Blue eyes and Blonde hair???

No, not everybody. It's 60% blonde, I think. My girl for example,
has long beautiful brown hair. And what eyes! .-)

No, we don't. But we can start, if you like :-)
Of course we can send you some programs, more or less regulary. We think
that would be great. And as you surely know, most of the demo's for
the ST's is European -- and nowadays SWEDISH!
The best ST-programmers in europe, and maybe the world, live in Sweden,
France and Germany. So I should say, at least.
[You do know of "The Exceptions", "The Carebears", "Bladerunners",
"SYNC", "Snails" and so on? I hope so...]

2437. Animation Display Application...

Newsgroup: comp.sys.atari.st
Date: 1989-11-05 18:40:34 UTC
From: antony@lbl-csam.arpa
Message-ID: <4156@helios.ee.lbl.gov>
Source record: 247459
Cross-posted to: comp.sys.atari.st,comp.sys.mac,comp.sys.amiga,comp.graphics

I am working on a generalized animation display application. I would like to make it be able to handle virtually all the various animation formats that exist out there. I would like information describing the format of animation files out there. The goal would eventually be to have this runing under X and have the user be able to load in any type of animation file and display it on his workstation.

If people from the various Amiga, Atari and Mac. user groups could send me information on the various animation formats for your machines, I would appreciate it.

Thanks for your help!

Cheers,

-Antony

Just a short question.

This summer I phoned W.P. to ask them if version 5 is out for the ST.
The person in custumer support (Atari section) said that they had no
plans on releasing it.

Is this the "new" version of W.P. everyone keeps talking about, and if
so, what do they want for it?

thanks, Danny

FDHD to ST conversion. By Axel K. Olmos

Thanks to countless miracles by Dave Small and his gang of technological wizards, we are now able to run Macintosh software on the Atari ST via Spectre 128. Unfortunately, the ability to run Macintosh software doesn't mean you can just put a Mac disk into an ST drive and run Spectre- until the release of the GCR. Before the GCR, the options available for moving software to the ST, were few and painful. You could send it through the RS232 onto a Spectre disk, or use a Translator, which unfortunately wasn't drastically quicker than the 9600 baud of the modem port. Then Apple came out with the FDHD, which allowed the transfer between IBM MSDOS 3.5" and Macintosh disks. This little disk drive was the answer to ST owners dreams.

I assume you have access to the following:

A double sided disk drive. (Doesn't everyone?!)

A Spectre. (Not the GCR, if you have that you're set!)

A MFS (Not HFS!) Partition on your hard disk with 720K free.
OR
A MFS formatted double sided disk. (Note, Spectre double sided disk are usually formatted HFS, you will need a special program to do this.)

Transverter. (This came with Spectre)

A Macintosh with a FDHD. (The new 1.44 meg Mac drive)

Stuffit on the Macintosh and on the ST.

I realize that is quite a large list. Most Spectre owners have all of that except for the FDHD Mac. This you will need to use at your rich friends house.

Part 1: The Mac

1. Run Stuffit on the Macintosh. Create a new archive on a hard disk or floppy, and add whatever files you wish to port to the ST into it. Be sure that the Archive gets no larger than ~710K or it will not fit on an MSDOS disk. I'll assume you called this archive the default, archive.sit.

2. Run the Apple File Exchange program on the Macintosh. Format an MSDOS 720K disk. Now Convert the archive.sit from the Macintosh disk to the MSDOS disk.

Part 2: The ST

1. If you have a hard disk with an MFS partition, go to 2.

Otherwise, get a hold of a utility which will format a double
sided HFS disk.

2. Run Transverter. Put the MSDOS disk in drive A and
set the ST source drive to A:. Set the destination Mac drive
to where ever your MFS disk or partition is. When it asks you if
you want to strip linefeeds, say NO. When it asks for creator
name and type for both, say "SIT!". (No quotes). (I have heard reports
that if your ST is one meg or less, you will have trouble transverting
large files)

3. After all your disks are converted, run Spectre and
unstuff the files!

Can't believe how easy that was? Neither can I. I stumbled
across that late one night when I had an ST an a IIcx in the same
room. It works like a champ.

I was hesitant in releasing this information because I
thought it might affect Spectre GCR sales. When I realized that
you must own a Spectre for this process to work, I forgot about my
worries. While this process is easier than others, it is still an
inconvenience. There is no better way to move Mac disks to the ST
than the Spectre GCR. This is just to hold you over while yours
arrives in the mail.

Have fun,
Ax.
(Special thanks to Frank and Clarence!)

P.S. I think if you format a disk on the Mac as MSDOS, then put it in
an ST, and copy ST files to it, then put it back in the mac, you might
be able to port ST files to the Mac...

Axel K. Olmos EECS/C UC Berkeley "But who can do more?"

2440. TT Unix, X Windows and slots.

Newsgroup: comp.sys.atari.st
Date: 1989-11-05 19:57:24 UTC
From: ATT3B@UCONNVM.BITNET
Message-ID: <8911060806.AA19807@ucbvax.Berkeley.EDU>
Source record: 247461

If the TT/X will run Unix (SysV or BSD), then it will run X-
Windows. X-Windows are public domain and there are enough
people out there able to port X-Windows.

If there are slots (>1) they will be used. The ST has no slots
and the ST Hardware "hackers" found thousands of ways of getting
something into the small plastic keyboard/cpu box.

The biggest problem, however, of the TT is the price. I really don't
care about the CPU (intel or motorola) as long as the machine runs Unix,
because i don't do any assembly language programming anyway (You don't
want to do this under Unix - no portability, no fun). So the TT will have
a hard stand against '386 Unix machines, which are down to about $4000 *now*.
In the newest Byte are adds for ~$5000 '486 machines! And that price will
get lower, too. With the $5000 announcement for the german TT/X, the price
is a little bit too high already now. And the TT/X will probably avail-
able early '91.

AND there are some programs for MSDOS machines, that the Atari boxes do
not have. There is no real Scheme for the Atari and others i'd like
to see.

Martin Stein

>The thing I don't understand is that the computer takes at least
>4 times as long to boot (possibly longer). Is TOS running some
>kind of memory test, or is it just zeroing out RAM?

When the ST boots it finds out the current memory configuration. It writes bit patterns throughout the memory of the machine and reads them back until it finds an error (ie end of memory). The larger your RAM, the longer this process will take.

>once that system is up and running, it takes a lot longer for
>applications to load and run.

As I understand it, when an application is loaded, the memory above that application is cleared (not just the BSS, *ALL* free memory below _memtop). So once again, the more memory there is in the machine, the longer this will take. I think there's a bit in the program header you can change to tell GEMDOS to just clear the BSS and leave the rest of memory alone. I don't know any more than that.

>The one thing that I noticed is that if I configure and install a
>large RAM disk (~1.5 Meg) the loading and running of applications
>goes much faster.

If you have a large ramdisk (or anything else that eats memory) then there is less free memory to clear when a program loads and so the application will start sooner.

It may be a good idea to try to follow up the magic bit to stop the memory being cleared but otherwise I guess you'll have to live with it. It's a small price to pay for such a gross amount of memory :-)

>>put quite different things in them.
>
>The buss is faster, agreed. But no law says that the _cards_ have to be
>faster. A modem, for instance, is inherently slow, so insert a few dozen
>wait states - who cares? Take your time about asserting VPA :-)

You're missing the overall argument. VME slots and PC slots both cost
extra money. One of the strategies Atari has always used is that you
should NOT sell the customer a slot he won't use, because that's
wasted money. Ever wonder why the first "open" Mac had lots of slots,
but yet most "open" Mac's sold today only have a few? It's because Joe
Average User doesn't need many slots because MOST expansions don't
require one.

Modem? Plug it into a serial port. Memory? Plug it into the
motherboard. Video comes standard. Hard disk on SCSI. This is what
Joe Average User needs.

Ethernet is the last thing. The TT/P doesn't come with this standard
(?), so you can either put it on SCSI (as in the various Mac versions,
which someone has running on the ST already?) or use your one slot for
that. The TT/P does come with serial networking, which might be fast
enough for Joe Average.

>>> [Richard Covert] But the TT Plastic
>>> is just another closed, limited support, game machine to me.
>>Much like the Sun 3/80, eh? Wow, great games.
>
>You neglect to mention the ethernet connector on the back of the 3/80,
>which excuses a multitude of sins.

You miss the point again. Richard claims that a "serious business system"
must have zillions of slots. The counterargument is that most workstations
don't need slots, if you have Ethernet and SIMMs and SCSI. The TT/P has
this, with an ethernet card. And you can use the TT/X or whatever it's
called as your fileserver.

You don't need zillions of slots on all computers. And Richard still
won't be able to find a fast modem to plug into a slot anytime soon.

;-)

> Servers are just what the average home user of a TT/<n>
>doesn't have access to.

Right, and a HOME USER with a TT/P doesn't need the things you plug into lots of slots. Why should a HOME USER then waste money on slots they won't use?

Greg Lindahl

I have two questions:

1. Does anyone out there have Fractal Magic? I have read that the ST version is superb, but this was before the comercial release.

2. I used to read this digest via bitnet, but now I subscribe to the comp.sys.atari.st newsgroup. Unfortunatelly, my university will not post messages to newsgroups (on that machine). Is Info-atari16 and comp.sys.atari.st the one and same? If so, will this post show up on comp.sys.atari.st also?

2445. Fast Mandelbrot Generator

Newsgroup: comp.sys.atari.st
Date: 1989-11-06 02:02:13 UTC
From: BAILEYS@FSU.BITNET
Message-ID: <89110522003525E.BPMX@RAI.CC.FSU.EDU>
Source record: 247481

This is mainly addressed to M.S. Powell, author of the fast Mandelbrot Generator available at archive-server%panarthea@sun.com, but I would certainly like to hear anyone's suggestions.

Sir, I have downloaded your program, and I love it! It is incredibly fast, which makes working with it much more fun. I am trying to create a stand-alone demo of Mandelbrot tendancies, something like a slide show of various zooms into the set. I wish to use your Mandelbrot Generator to get the images (I like the color-cycling mode), and so I obtained DEGASNAP from the aforementioned archive-server. It takes input in the form <ctrl>+<alt>+<keys a-z> to create a DEGAS file DEGAS_x.PIX (x=letter, X=resolution). Unfortunatelly, the two applications do not like each other, the Degas dumper does not work within your program. I am not familiar with M68000 Assembler, and would not even know where to start to make these two things work (or for that matter, where to add such a routine to your code). Would it be possible to give me some hints? Or perhaps update your code to inclue a screen-save function? It might be possible to rig your code so that theTSR De Ram could see the keys. I do not mind doing the work myself (with your permission, of course), but I am not sure I could!

Bob Marley

FSU Comp Sci

P.S. I also tried a DEGAS screen saver called DUMPIT, and it did not work either.

2446. GEM help needed

Newsgroup: comp.sys.atari.st
Date: 1989-11-06 02:20:00 UTC
From: hedger@inmet.inmet.com
Message-ID: <30200010@inmet>
Source record: 247479

Okay.....I'm close to giving up (not really just terribly frustrated).
I've spent all day trying to get a full screen rectangle to appear on the
screen and wait for me to hit the return key before ending the GEM
program. I've been largely successful except that, try as I might, I
cannot get the screen 'fill' stuff to set to a particular color.

I do the following:

```
appl_init()
v_opnvwk()
vsf_perimeter()
vsf_style()
vsf_interior()
vsf_color()
v_bar()
```

The above stuff works and when the program is run I get a full screen
rectangle. I can adjust the parms in vsf_style and vsf_interior and
get the expected different patterns and cross hatching and stuff.
No matter what I do though, the vsf_color call doesn't seem to work.
I never get a rectangle with a colored fill, whether it's a solid pattern
or one of the special patterns.
All of the examples I can find in my Mark Williams C documentation or
the Balma/Fittler GEM book basically call vsf_color with the vdi handle
and the color. This is what I'm doing....no luck.

Obviously I haven't included all of the var declarations and the stuff
to wait for the return key to be hit....this stuff all works fine.

If anyone can shed any light on this problem, I would really appreciate
it a lot.
and ....
thanks again,

```

Source record: 247476

/* ---------- "Prolog 10, Common LISP" ---------- */
I address this especially to continental European ST users:

Auf Deutschland gibt es ein Prolog 10 oder ein Common LISP?
Ich kenne Cambridge LISP und MProlog, aber sie sind nicht, wass ich
suche.

Es tut mir Leid, dass mein Deutsch nicht so gut sei, aber weil soviel
ST Gebraucher Deutsch sind, glaubte ich, dass sie hier English immer
lesen nicht mussen woellten.

Danke,

David Megginson, Centre for Medieval Studies, Toronto
/* End of text from silver:comp.sys.atari.st */

Well isn't *this* a fine how-do-you-do? Even if we live in the U.S.
perhaps we would like to know what you're saying.

Sabe Vd. que digo? Yo espero que Vd. no comprende que digo aqui y tambien
te pongas muy paranoioso :-)

Ciao.

2448. What's wrong with the AMY?

Newsgroup: comp.sys.atari.st
Date: 1989-11-06 05:20:28 UTC
From: cmm1@CUNIXA.CC.COLUMBIA.EDU
Message-ID: <CMM.0.88.626332828.cmm1@cunixa.cc.columbia.edu>
Source record: 247477

After having posted a few queries on comp.sys.amiga, I recieved almost 200K+ of very helpful info. I even went out and bought a few Amiga mags to see a bit of the hype first hand. I liked what I saw. It is amazing what the availability of expansion slots does for a machine. There were pages of add on video boards, RAM expansions (16 and 32 bit), disk controllers, and quite a few 68020 and 68030 add on boards. Brand loyalty aside, why would anyone sit around and continue bitching at Atari when they can go out and buy an Amiga 2000 or A2500 and just stuff whatever goodies they want in the mondo-expando slot thingies? I was dumbfounded. I always thought that the Amy users were in the same hapless boat that Atari users were in, but I was mistaken. When I eventually have to bring my Mac IIcx back to work, I think I will buy an Amiga. To all those people I ever ragged on about the Amiga "game machine", I stand corrected and humbly apologize.

Also, has anyone noticed how difficult it is becoming to even find ST magazines? I work on Wall Street so I pass by some of the largest newstands in New York City every day. Many of them have either cut down on the number of ST mags they carry or eliminated them all together. Walking around Grand Central Station for an hour and not being able to find one ST magazine does not bode well for my lil' ST. It is a shame, but technology seems to have passed the ST user by...and now back to Air Warrior. :-)

2449. TT

Newsgroup: comp.sys.atari.st
Date: 1989-11-06 05:29:44 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <4344@blake.acs.washington.edu>
Source record: 247478

I get the impression there are lots of disatisfied
"want to own a TT" netters out there. (no sh__!) Not simply because
we're going to have to wait for Comdex and then some, but
because the first issue TT will not really be the machine
of our dreams. I know for myself, I am not about to throw
a couple (?) of thousand into a system to satisfy me in the
short term.

I need faith that the next system I buy will be open enough and
powerful enough that i can work with it for a few years without
despair. If there are "lots and lots" of VME cards out there,
wouldn't it be nice to be able _IF YOU WANT TO_ to put lots and
lots of VME cards in your TT? How hard is it going to be
to eventually upgrade the TT/P to an 040? WOuld it be easier
to do so on a TT/x? WHy/why not?

The TT/x sounds like a great machine. How many netters are going
to bypass the TT/P and wait for the TT/x? Basically, what I am
saying is, can we really get all that excited about the TT/P?

So it's going to cost more to get better graphics, better RAM,
more slots etc... but, I am not necessarily looking for a "deal".
Again, you _sometimes_ get what you pay for. At this point, I
am willing to PAY for it.

A Mac? An IBM? No way...

I want a state of the art machine and still be
able to run my niffty ATARI software i have invested in over the
last several years.

The strange thing is that i have a hard time believing that i
am still considering buying an 030 that won't multitask all that
niffty GEM software i have on my drive.

Oh no, not this again: Multitasking GEM/TOS?

> WELL DONE ATARI.

Humph. It IS nice to have an OFFICIAL statement on a subject that should have been settled YEARS ago, but what a statement it is! I guess ATARI figured that if they waiting long enough, and THEN posted a "standard", we would forget all the good arguments AGAINST this particular form of brain-damage. This "new" extended argument spec is Mark Williams form, with a thin (optional) layer of veneer on it, even after it was flatly stated that the MWC form WOULD NOT BE ACCEPTED due to the ways in which is was broken. It appears that politics has won out over technical merit once again. I don't expect that Atari will change their mind on this issue (without taking another YEAR to post an answer), but I will include some information on how the MWC form (at that time) and Atari's "new standard" are broken. Remember, one of the design goals of this standard is to be upward compatible with naive programs.

David Parsons wrote (in March):
| Say, for example, that I call the teeny-shell from a program that uses
| MWC arguments; Teeny-shell will get ARGV=<0>ARG0<0><ARG1<0>...<0><0>.
| which will parse to at least one valid environment variable - ARGV=ARG0.
| If any of the arguments I passed into the teeny-shell have `=' in them,
| they, too, will get converted into valid environment variables. (if I
| do `tsh -i PATH=g:,c:\bin,c:\games,. some-initial-command', for example.)
|
| And if this child (the one who doesn't grok the MWC `standard') does
| a putenv() or two, it will end up (most likely) putting new environment
| variables at the end of the arglist, after the corpse of the argument-list.
|
| The diddles to the length of the cmdline tail will prevent children from
| incorrectly reading the environment, but there will still be this
| collection of garbage left orphaned in the environment. And if the teeny-
| shell calls another process that groks MWC args, which then forks off another
| process, well, then that orphan will see the first ARGV= value, which is

| now being treated as a valid environment variable, and get stuck with the
| fun prospect of trying to figure out if it is, indeed, the start of the
| argument list or if it's something else.
| Say, for example, that I call the teeny-shell from a program that uses
| MWC arguments; Teeny-shell will get ARGV=<0>ARG0<0><ARG1<0>...<0><0>.
| which will parse to at least one valid environment variable - ARGV=ARG0.

| now being treated as a valid environment variable, and get stuck with the
| fun prospect of trying to figure out if it is, indeed, the start of the
| argument list or if it's something else.

The major problem here is that the NUL separated pieces of the extended
argument list appear to the naive program AS ENVIRONMENT VARIABLES and
my be reshuffled (some shells may SORT them) by that program, modified
and passed on to a program which comforms to this "standard". Now what
happens when this conforming program finds "ARGV=" right up at the front
of the (sorted) environment and THROWS AWAY THE WHOLE ENVIRONMENT. It
does this because the command line length is not the magic value, thus
the "ARGV=" list is not from it's parent, but is still used to terminate

the environment!

I think I've read some time ago, that they have solved this problem
with the Blitter-TOS.

If you have an older version, you can put the program NULLFILL in
your AUTO-folder witch also makes loading a program faster.

Stefan Focke (focke@gmdzi.UUCP)

2456. New Mega STs and TOS 1.4

Newsgroup: comp.sys.atari.st

This is all the more reason NOT to print it.

The author of this survey might have provided a service by extracting
and collating the information that he said that he was collecting.
I think there were only 10 distinct respondents, so 30 lines might have
done it.

As it is, this posting looks like a dis-service.

2464. GEMDOS extended arg spec

Newsgroup: comp.sys.atari.st
Date: 1989-11-06 14:01:34 UTC
From: MALCOLM@tower-vax.city-poly.ac.UK
Message-ID: <8911070803.AA12551@ucbvax.Berkeley.EDU>
Source record: 247374

Hmmm. Seems to me like a non-conforming child might have problems with this spec if the circumstances are right (i.e. wrong). Example:

Suppose I Pexec a child and want to pass an argv[1] of "PATH=bletch" (don't ask why!); suppose further that the *real* environment doesn't contain a PATH variable. Now the child starts up with an environment something like:

```
REAL_ENVIRONMENT_VARIABLE=anything
ARGV=
c:\bin\foo.prg
PATH=bletch
```

If the child's startup code knows nothing of extended args and doesn't clobber ARGV, then any subsequent getenv("PATH") will get the value of something which was never intended to be an environment variable. PATH is just an example, of course: it would happen with anything.

The xarg standard didn't have this problem, if I remember rightly, since the extended args were in the parent's address space rather than in the child's environment. But that's probably undesirable - the child ought to leave the parent's space alone. But what's wrong with something like this?:

```
REAL_ENVIRONMENT_VARIABLE=anything
ARGV=
ARGV0=c:\bin\foo.prg
ARGV1=PATH=bletch
ARGV2=etc
```

Yes, I know what's wrong with it: it's yet *another* standard, when the MWC one is tried and tested, and if startup code has to deal with all the standards then we'll all need Megas (hey, wait a minute :-). Just felt like being pedantic, that's all.

Now, a small gripe (more a flicker than a flame).
silver!jkain@iuvax.cs.indiana.edu complained about some German from David Megginson:

> Well isn't *this* a fine how-do-you-do? Even if we live in the U.S.
> perhaps we would like to know what you're saying.

Writing queries to non-English readers (not including Americans ;-) in their own language is a nice touch I suppose, but maybe a bit unnecessary since if they didn't read English they wouldn't be reading this list. BUT (a big but): I'd *far* rather struggle through some simple German than the megabytes of why-Atari-are-jerks/why-Commodore-are-better drivel that we see every day here and which I've been seeing for *years*. 90% of this stuff says nothing new, so what purpose does it serve? It certainly doesn't gee-up Atari: they've

heard it all, they *know* there are p*ssed-off users out here. Yeah, I know I'm wasting my breath...

2465. Spectre-GEM partition file transfers

Newsgroup: comp.sys.atari.st
Date: 1989-11-06 14:15:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8911070803.AA12569@ucbvax.Berkeley.EDU>
Source record: 247385

My true commercial copy of Spectre GCR arrived today (up to now I had a gamma test version) and I have not had a chance to check out Transverter yet. I agree with the netter who asked Transverter to support HFS transfers. What would be even better would be for someone to write a Mac code that would access the GEM partitions (most Macs come with DOS disk capability now) to allow direct read/write to GEM partitions while in Mac mode. Any whiz kid wanna pick up the challenge on this one?

2466. Vapourware!!!

Date: 1989-11-06 14:28:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8911070804.AA12600@ucbvax.Berkeley.EDU>
Source record: 247376

How many netters have actually used a NeXT computer or even seen one. Just because YOU have not seen one does not mean it does not exist or it is vapourware. The same goes for the TT, the ATW, the STACY, the LYNX.

Why do some many netters bash Atari in the Atari forum? If you hate Atari so much, get on the Mac or PC forum circuit and stop suffering. Let us Atari users have fun without having to listen to your bitching.

2467. Spectre and other Mac emulators

Newsgroup: comp.sys.atari.st
Date: 1989-11-06 14:55:00 UTC
From: E_GS18@vaxa.nerc-murchison.ac.UK
Message-ID: <8911070804.AA12638@ucbvax.Berkeley.EDU>
Source record: 247386

Hi! Especially to the Mac emulation experts - may I pick your brains?

** Background
I am working in collaboration with University colleagues in California, who are totally Mac oriented. I need to exchange documents and data with them in Mac formats. My first inclination was to get a Mac emulator for my Atari, but, as I will describe below, my attempts have not worked out, and my employers are now the proud owners of a shiny new SE 2/20 which sits on my lab bench, alongside my ST. I continue to be interested in buying a Mac emulator to use with my home Atari, but I have many questions, most of them rather basic. Although I have been reading the lists for some months, these issues have not come up directly, so maybe the answers will be of interest to a wider group.

** A mini-review of the Aladin emulator
I describe my experiences with this product, in part because it may be of general interest, and in part to place my questions about the Spectre in context. My first step in the quest for an emulator was to approach my friendly local Atari dealer. He was not too clued up on Mac emulators, but let me have an Aladin emulator and its associated disk translator for a couple of weeks on a 'sale or return' basis. The basic Aladin emulator consists of the usual cartridge, which comes with a set of 48k (?) ROMs, and a set of disks - Atari, Mac and Aladin formats - with the software which rearranges the ST to make it look like a Mac, some software for copying Mac disks to Aladin format via the serial ports, and a hard disk installation utility. Note that there is no Mac system software. The (floppy) disk translator consists of another cartridge and a program for the ST which runs under TOS. To copy disks, it is necessary to switch off the ST, replace the Aladin cartridge with the exchanger cartridge, remove any external floppy and connect the output of the translator cartridge to the external floppy port, and reboot TOS. The file copy program takes five minutes or so to copy an 800k disk, and requires a bit of disk juggling even on a 1Mb machine. The makers of Aladin say that it may not be able to read Mac disks on all STs. For my application, where I anticipate doing a fair bit of work with Apple format disks, all this is a major drawback. In principal, I could perhaps buy a second 1Mb Atari and keep it on standby, but the cost doesn't make sense. The Aladin/translator combo costs about US$600 in the UK; a second Atari would cost about the same, and they total to more than the cost of a Mac Plus! (All 'education' prices, by the way). Which brings me to the second drawback of the Aladin - because it has the very old ROMs, it won't run current Mac software, such as Hypercard and Excel 2.2 :-(. I had a very hard time finding a friendly Apple dealer who would let me have a copy of an out-of-date Mac system, and I never did get the Aladin to read HFS format Mac disks, even though the documentation said it was possible. It seems that a special disk driver is required; I was unable to trace a copy. So I returned the Aladin to my friendly local dealer with thanks but no sale!

** Spectre in the UK
I also tried to find out about Spectre, having seen the good notices on this list. The UK distributors are HiSoft, originators of the excellent DevPac ST and other products. They appear rather uninterested in marketing the Spectre, however. My friendly local dealer wasn't able to get any useful information from them and when I called them myself, I found only an answering machine. I left a polite message explaining my application and requesting information, but to date have received no response. I also tried to email Dave Small at the uucp address he gave here, but I gave up after about half a dozen attempts to stuff the message down a DECnet/JANET/BITNET/uucp chain, which taught me some more about mailers, but not much about Spectre! The only info I have managed to get on Spectre is the prices of UKL289 [US$470] for Spectre 128, plus about UKL90 [US$140] for startup kit and printer drivers, and UKL379 [US$600] for the Spectre GCR. Questions below!

Last weekend, I called at another local Atari dealer. He had an interesting demo disk, apparently from a German company who expect to market it in a few months' time, which turned his Mega into a Mac. Please note: no cartridge in sight. I wonder about this. I guess the disk contains a copy of the firmware from the Mac ROMs. The Atari was running Version 6, so it must be a copy of the 128k or 256k(?) ROMs. Given Apple's litigious inclinations, I would be surprised if they could get away with such a thing. Can any of you shed any light on this product?

Dealer 2 also said that he was planning to import some Spectre 128s direct from the US and would undercut HiSoft to sell at about UKL200 [US$320]. He said also that he would be marketing a cartridge which would allow any normal ST external drive to read Mac disks. This was not connected with Spectre GCR, which he said was not available yet in the US (so I informed him of what I had read here!). Again, any information? I gained the impression the Mac disk reader had a European origin. The description did not match the Aladin translator.

** At last! The questions!
1. I understand that Spectre 128 uses 128k Mac ROMs, and runs Version 6 software. I have also been told that current Macs are running 256k ROMs and that Version 7 will support virtual memory (though I presume only on the '030 models). How will this affect Spectre users?

2. What facilities for disk access does Spectre GCR support? Can I read files directly from a Mac disk into my application? Most importantly, is the GCR an add-on extra to the Spectre 128, or is it complete in itself?
(Comment: at UK prices of UKL760 [US$1200] for 128+GCR+support kit, it would make a real Mac look quite cheap!)

3. Are there any differences between the US and UK versions?

4. Should I consider buying one when I am in California next month? How much should I expect to pay?

5. Can anyone comment on the reliability of Spectre 128 or GCR?
(Comment: I bought a BMS hard disk kit a couple of years back, and experienced a chip failure within a couple of days of starting up. No flames on BMS; chips

do fail sometimes and they exchanged the card for a new one without question on my next visit. Nice guys to do business with. But I'm a long way away if I am looking for support!)

6. Is there a good Atari shack in the Santa Barbara area? Given that it's the kind of area where anything less than a Mac IIci is considered demode (please reinstate accents!), I would be surprised to find one. Alternatively, I will also be visiting the west Bay area, specifically Menlo Park, although I expect to be very busy at that time. Can anyone recommend a good place? Directions from, say, downtown Palo Alto at El Camino Real would be particularly helpful. Perhaps there's a good store in Sunnyvale :^)

I hope you guys don't find the length of this msg an abuse of bandwidth.
As usual, I'll happily summarize comments received by mail.

2469. WordPerfect ST vs. version 5.0

Newsgroup: comp.sys.atari.st
Date: 1989-11-06 15:04:33 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891106.09014497.067340@SFA.CP6>
Source record: 247377

A question was asked regarding how the ST version of WordPerfect compared to version 5.0 for other systems: IBM and Amiga.
The current WordPerfect ST has always approached version 5.0 in features and is more flexible than version 4.1 for the IBM.
What we don't get is a true WYSIWYG environment and the ability to mix graphics. We also don't have the ability to SORT.
We have the ability to use our accessories which is a feature not existing for the IBM version 5.xxx or the Amiga 5.xxx. These two versions have to use libraries supplied by WordPerfect to give an accessory type world. Both the Mac versions (version 1.xxx) and ST versions allow real pull down menus or key commands. Currently, the IBM and Amiga versions don't allow this without optional third party add-ons.
In my biased opinion, WordPerfect ST is a superior product if one does not need a graphics/text document, that is, mixing pictures, etc., with text. It is fast and is phenomenally flexible.
In my other biased opinion, if one needs to have such a constant graphics/text environment in a fast word processing mode, as opposed to a DTPing mode, I'd recommend buying Spectre GCR, connect it to at least a two-megged ST, and then buy FullWrite Professional from Ashton Tate. I use both products several hours a day on my ST and honestly wonder how I was able to write without them.
WordPerfect is soliciting ideas from users. The best idea is to "join the revolution" and *BUY* their product if one doesn't need the graphics/text environment. It is only if WordPerfect's bookkeeper can post a profit for the ST version when we will see further enhancement. We will get a FullWrite type environment if WordPerfect is truly supported by STers. Incidentally, the current version is incredibly rock solid...

DISCLAIMER: I don't work for WordPerfect, Gadgets by Small, or Ashton Tate, but sure wish I had the brains to do so....

if people would read the accompanying docs carefully (not just looking at the price) you would see that the $30 shareware fee is for ALL seven quick utilities, including Quick ST. compare that with the approximately $50 for that other gem accelerator T---- ST. it's up to you folks. you make the decision. but please, look and READ the docs before you make a statement like the above on a public network.

From: mcsun!unido!gmdzi!focke@uunet.uu.net (Stefan Focke)

I have heard, that in Germany also in future new Mega STs will be delivered with the old Blitter TOS, not with TOS 1.4.

Is this the same in the rest of the world?

Does anyone know a good reason, why Atari sells new hardware with a faulty TOS if they have a better one.

I just bought a new Mega 2 and it did not come with TOS 1.4. According to more than one of the dealers I talked to, Atari is not sending out any new Mega STs with TOS 1.4. TOS 1.4 was only to be available as a dealer upgrade. One of them mumbled something about a large stockpile of old ROMs but was unable to confirm it.

Now, I'm trying to find a dealer who has TOS 1.4 upgrades! The upgrades seem to be very slow in making it to the New England area.

>Are the slots individually addressed?

The VME BUS is a real BUS: all slots are just connected 1:1.

It is therfore possible to build a tranceiver card driving a backplane
to get more slots for a 1-slot TT.
Drivers and backplanes are pretty expensive; probably thats the reason
for Atari to exclude the backplane...

>
> Dave Halliday.

Judging from an item in the U.S. magazine Computer Graphics World, the ATW appears to have been announced, although with Atari Corp.'s blundering public relations department it's hard to tell.

(Why is it that every time Sun sells more than a trunkload of SPARC machines there's an item in the New York Times, but Atari can pop up with something like the ATW and it's a better-kept secret than Zsa Zsa Gabor's real age? For that matter, why did Atari push its "business" Mega by distributing photos showing a childlike Neochrome drawing of a robot?)

The article says:

"Atari Computer (Sunnyvale, CA), best known for its PCs and video games, is now testing the waters of the graphics workstation market. Designed for CAD and other graphics-intensive applications, the new ATW (Atari Transputer Workstation) combines the Inmos T800-20 microprocessor with Atari's proprietary Blossom graphics processor. It has a suggested list price of $7995."

The article then quotes a Cambridge, Mass., marketing research honcho who throws cold water on the whole idea and says it's "difficult to see how Atari's going to make a splash at this point."

The article, written by CGW associate editor Debra Rosenberg, includes a lot of numbers (4 to 16MB of RAM for the T800, 512K to 4MB for the 68000 coprocessor, 80MB hard disk, resolution "from 1200-by-960 to 512-by-480."

It makes no mention of the Transputer's ability to be combined with other Transputers for parallel processing, which I thought was the whole point of the ATW. It identifies Helios as "Atari's version of Unix." It quotes Atari as saying Dynacad, Autocad, Versacad and other applications are in development.

An accompanying photograph shows a Mega keyboard and what appears to be a Hitachi 18-inch color monitor. The CPU box is not shown. The monitor display has a number of images, both graphic and text, in overlapping windows. (The story quotes Atari as saying it will run X Windows 11.2, C, Modula-2, Fortran 77, Lisp, Prolog, BASIC, Occam and Strand.)

>I thought it was 16MHz only for CPU and cache memory, going down to 8 MHz
>externally. How does that work???

Read Dave Small's article in the December START magazine. He reviews
16 MHz accelerators as well as software accelerators like TurboST.

Dave does a good job of putting performance in perspective. That is,
many systems are "disk bound", meaning that CPU performance has little
to do with the overall performance of your system because 90% of your
foot tapping occurs while waiting for your floppy or hard disk to
access data. There are both software and hardware solutions to this
problem depending on what you've got for hardware. In this department
I do have some experience and heartily agree with Mr. Small. For one
thing, all disks are NOT created equal. Also, disk access slows down
as the disk fills up. This problem is not unique to Atari BTW! The
latter problem can be improved with software, the former by buying
a faster disk.

Dave also points out that many components are unable to operate at
16 MHz so that you are unlikely to see a 2 to 1 improvement in
performance in any practical application. Not that you won't see
a performance improvement, you just might not be as fast as you
expected.

Anyway, I've never tried any of them, so I can really only point you
to Dave's article. I highly recommend that you read it before laying
down your $$$.

I hope this helps,

2482. Mega with TOS 1.4 crashes!

Newsgroup: comp.sys.atari.st
Date: 1989-11-06 18:43:32 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440075@hplsla.HP.COM>
Source record: 247365

I've had TOS 1.4 in my Mega ST2 for about 3 weeks now and there is no longer any denying that my computer's reliability went out the window with the old ROMs. Prior to getting the new ROMs, I only had bus and address errors when developing my own programs <grin>. After getting TOS 1.4 I started seeing alot of seemingly random bus/address errors. This stopped happening in commercial applications when I curbed my use of "makefast", but I still get an occasional bus error when copying files and changing resolutions and rebooting. Yesterday came "the big one" - while booting, there was a write error to sector 1 and a bus error. (I swear the bus error came a second or two before the write error was reported, is that possible?). The boot partition was converted to two "files" with illegal names, the size of which totalled a few billion bytes, heh-heh. Sector 1 contained a bunch of alpha junk that included "ICDBOOT.SYS" and I know that shouln't have been there. (I verified this after recovery). Overall, I do not know why any writing to sector 1 should have been occuring during boot, and whatever got written there was wrong.

Fortunately, the other disc partitions were intact and I was able to recover by booting from floppy, zeroing the boot partition, re-installing the boot driver, and backing up. I only lost a few files.

I have two questions:

Does anyone have advice about what may be the problem?

Would it have been possible to effect repairs on the disk partition? Any programs that would have helped? Would it be feasible to try running Dr. Norton on PC Ditto?

Any - and all - advice is appreciated!

2483. Has anyone heard of TCOS database?

Newsgroup: comp.sys.atari.st
Date: 1989-11-06 18:56:49 UTC
From: canada@crash.cts.com
Message-ID: <660@crash.cts.com>
Source record: 247496

I have discovered a wonderful ``index card and button'' type database called TCOS. It's public domain, and supposed to be from Britain, but the documentation that comes with it gives only a name of a person to contact but *no address*! I want to send in my $$ and my suggestions for enhancements. Perhaps someone else has heard of this program and knows more about it? Here's the info:

TCOS version 1.2
Perfect Evolution 1989
Matthew P. Aubury

Can anyone supply me with more information? Is there a newer version of the program available anywhere?

2484. Wanted: PD CAD for 1040ST

Newsgroup: comp.sys.atari.st
Date: 1989-11-06 19:13:28 UTC
From: glenb@hpnmdla.HP.COM
Message-ID: <810015@hpnmdla.HP.COM>
Source record: 247364

I've got a friend here who is interested in obtaining a PD CAD program.
Does any such thing exist for the Atari 1040ST (hey...I drive an Amiga...oops,
probably shouldn't admit that here :-))? If so, how can I get at it? I
haven't been able to find an archive-server address.

E-mail would be appreciated since I normally don't hang out in this group!

TIA,

glen

Maybe this has changed in TOS 1.4, but in TOS 1.2 there was still a limit
of 32 kByte for the environment. This is enough for most applications, but
is different from "no limit".
It's nice to have an official standard for extended argument passing. Can we
hope that this will be integrated in future TOS versions (1.8) ?

| It is right that the startup code should
| do the right thing (mshrink or not), but there are startup codes
| available (e.g. APPACC.A) which ensure the correct startup in both
| cases.
The problem is not whether the startup code should Mshrink or not.
The problem is finding the basepage address. The method used by
all the startup code I have seen uses the text base address minus 256 as
the basepage address, and that is not the right way to find it.

| The other problem (find out the way the program is invoked)
| can be solved simply by using the AES-function shel_read, which
| returns a pointer to the string containing the program name
Shel_read doesn't help if you are run from a command line shell which
doesn't launch programs using shel_write. This is another example of
problems caused by ST programs having to live in two different worlds,
the worlds of GEM and GEMDOS. Allowing the startup code to use A0 to
find the basepage address is our way of making it a little easier for
programs to live in both worlds.

dmk@cbnewsi.ATT.COM (daniel.m.kuster..jr) writes:
| The thing I don't understand is that the computer takes at least
| 4 times as long to boot (possibly longer).
As numerous people have pointed out, the operating system clears
all of free memory for each program before loading. Not only that,
but the original ROM TOS does this slowly.
Also as some have pointed out, one solution is to use Pinhead, which
takes control of program loading when it sees GEMDOS clearing memory,
and only clears as much memory as the program needs.
IMHO, a better solution would be for you to get the Rainbow TOS
upgrade. This allows you to speed up program startup selectively (some
programs insist on having all of memory cleared), AND it has lots of
other benefits as well.

alderaan@tubopal.UUCP (Thomas Cervera) writes:
>(Imran Anwar) writes:
>> DOES ATARI LASER PRINTER NEED MORE THAN 1 MEG RAM ?
> Yep.

Nope. You can use the Diablo 630 emulator to get text output using any GDOS font using practically no memory. While the page is being imaged, the CPU is building band-buffers, keeping ahead of the beam.

You can't get GDOS output: the GDOS SLM driver needs to image the page all at once, then print it, because it can't image bands fast enough (they can be arbitrarily complex!).

Even the Diablo output has limits: if a line or group of lines is too complex, it can't keep up. This isn't normally a problem, but something like nroff/tbl output, with lots of overstrikes and reverse linefeeds can cause trouble.

The Diablo emulator will also draw horizontal and vertical lines and print bitmapped images anywhere on the page, as large as will fit in memory, but it will magnify at 1x1, 2x2, and 4x4 printer pixels per bit in memory.

2492. Re: TOS, Zoo, or Zen? (DTA stuff)

Newsgroup: comp.sys.atari.st
Date: 1989-11-06 20:39:42 UTC
From: apratt@atari.UUCP
Message-ID: <1782@atari.UUCP>
Source record: 247355

Let me clear up what Ken said:

Point 1: You can't use the private part of the DTA, and if you do, your program won't work on TOS 1.4 because the private part of the DTA changed entirely. Even if you figure out what it's used for, you will lose when a new TOS comes along and blows your program up again.

Point 2: If a Fsnext() returns ENMFILES ("no more files"), the public part of the DTA contains nothing useful. It does not, for example, contain the data from the file which matched the previous Fsnext(). If you want to do Fsnext() until it fails, and you care about what was there before it failed, you have to copy it out.

You don't have to copy out ALL of the DTA, of course, just the public parts, and of that, just the parts you care about.

No part of the DTA needs to be saved or preserved if you don't want to do another Fsnext on it: there is no vital GEMDOS information there. Fsfirst completely reinitalizes the DTA (or returns "file not found" or "path not found").

>The strange thing is that i have a hard time believing that i
>am still considering buying an 030 that won't multitask all that
>niffty GEM software i have on my drive.

Why on Earth do you find this difficult to believe? You clearly
have not thought through the implications of a multitasking TOS.

What parts of the system are task-specific, and need to be switched
with the task's context? The CPU registers, sure, and GEMDOS's
current-process pointer. But what about the "Bconin() returns the
shift key state" bit in _conterm? What about the critical error
handler? What about the 200Hz interrupt vector (or, worse, something
in the MIDDLE of the 200Hz interrupt vector chain)?

No multitasker can satisfy "all that nifty GEM software" you have. What
CAN be done is this: we can lay down rules for multitasking, and write
a multitasker within those rules, and programs written with those rules
in mind will work. Furthermore, programs written *without* those rules
in mind, but which follow them anyway, will work. Therefore the rules
should be broad enough to cover a wide range of existing programs.

What I'm trying to say is THIS IS NOT EASY. It's not even Moderately
Difficult. This is A Hard Problem. The presence of a 68030 doesn't
make it any easier.

As anyone who reads the two online ST mags knows there is someone (a software developer me thinks) who is trying to form a grass roots movement to support the Atari line of computers, and he calls this movement THE REVOLUTION.
Now I'm all for supporting my system of choice but this guy seems to be going way, way off the deep end. I mean he's talking about writing the ROSEANNE show to get them to do a special episode where the family wins an Atari computer and then has REVOLUTION team members set up the system for them , oh that sounds real funny ha,ha,he,he,hummmmm. He also wants us to write the ABC 20-20 show to get them to cover the REVOLUTION as it progresses to ****VICTORY**** (dum,da,dummmmmm), Or how about that idea of sending a get well soon banner to a sick child from who else, THE REVOLUTION (why not send a get well soon card to a sick child without the promotion). As well as a few other brilliant ideas involving CBS news, George Bush, ect ect.
If this guy does half the the things he wants to do he is just going to convince whoever he sends this crap too that Atari users are idiots so the Atari computers MUST be toys.

PLEASE, PLEASE dont support this guy and his REVOLUTION. (I think he must be about nine years old, what with all this dreaming he's doing, Na, my nine year old nephew has more brains)

OVERTHROW THE REVOLUTION, Before it overthrows YOU.

covertr@force.UUCP (Richard E. Covert) writes:

| Will MWC have to be changed to support the new TOS 1.4??
In terms of DTA management, no. The point of my original posting was
something that went out in the Developer Rainbow TOS relese notes:
GEMDOS DTA handling has changed. If you relied on undocumented features
of GEMDOS DTA handling, you may lose under Rainbow TOS. The thing that
may catch you unawares is that GEMDOS _will_ trash your DTA after an
Fsnext() that fails. Apparently, previous GEMDOS versions left the
filename part of the DTA alone after a failed Fsnext(). So if you're
searching for a bunch of files, copy what you need out of the DTA
before each Fsnext() operation, and you won't get bitten.

Perhaps I should clarify what I posted before. I'm getting sick and
tired of seeing rumors and misinformation bandied about as facts here
and elsewhere.

If it's a TT, it'll run Unix. It may require adding memory or disk storage,
but it will run Unix.

I don't recall a public release of Atari specifications at all for any
tower configuration of TT ever. So if you read or write anything
specific about any such machine, it's pure fabrication.

Subject to change without notice.
Your mileage may vary.

2503. VMEbus information

Newsgroup: comp.sys.atari.st
Date: 1989-11-06 23:31:34 UTC
From: FNDDR@ALASKA.BITNET
Message-ID: <8911070806.AA12870@ucbvax.Berkeley.EDU>
Source record: 247381

After reading all of the bazzfazz about the alleged TT VME slot, it seems
to me that there are a lot of misinformed/disinformed people when it comes
to VMEbus. May I suggest reading the following before continuing:

IEEE Standard for a Versatile Backplane Bus: VMEbus
ANSI/IEEE Std 1014-1987; ISBN 0-471-61601-X
Available from IEEE for about $25 (don't have the price list at hand)

The VMEbus Handbook by Wade D. Peterson (no ISBN) - $44.95 postpaid
VITA - The VMEbus International Trade Association
10229 N. Scottsdale Rd, Suite B
Scottsdale, AZ 85253
(These guys don't take credit cards, send a check)

VITA also sells a 354-page book, the VMEbus Compatible Products Directory.
Want to speed up your system with a AMD Am29000 RISC board with 16MB RAM?
No problem. You want an internal modem? Motorola has some for VMEbus,
5 or 10 Mb/s, take your pick. You can even get 286 and 386 PC compatibles
that plug into a VME slot. All it takes is money. Most of the above
are in the $5-10K range for the basic board, more for extra RAM or whatever.

VMEbus isn't for weekend warriors, it is for industrial and scientific users
with big budgets. The cost of the TT will probably be a negligible part of
a VMEbus project.

If Atari is in fact going with VMEbus, it takes a lot of guts. We'll just
have to wait and see if it works out. I just hope they don't do something
really stupid, like release an "almost but not quite standard" version,
as with the use of "ACSI" rather than full SCSI on the STs. But if they
do it right, they may take a piece of the action in the workstation wars.

Don Rice
FNDDR@ALASKA.bitnet
None of the above has anything to do with what I'm working on, so it doesn't
need a disclaimer like this one.

2504. Re: TT Unix, X Windows and slots.

> a hard stand against '386 Unix machines, which are down to about $4000 *now*.
> In the newest Byte are adds for ~$5000 '486 machines! And that price will
> get lower, too.

You can get a 386 Unix box with hard disc and monochrome graphics monitor
for less than $2000 *NOW*. And 8 expantion slots.

A friend of mine got a 386 box with 4Meg Ram 800x600x16clours VGa
and 71Mb 18ms hard disk two floppies (1.2M and 1.44M) etc. for $3000.

You use unix for your hacking and some MSDOS compatibility windows
for standard applications and other powerful software developed
for that silly chip which calls itself a microprocessor.

Nobody has mentioned the amazingly low cost of extentions of a 386 box.
A hard disk, a floppy, I/O ports, modems, Memory...
Who can beat those prices?

Can Atari give a Unix box with
- Many expantion slots
- Lots of memory
- High res color monitor
- Fast and big hard disk
- High Density floppies, I/O ports etc.
-*Availability of the cheapest expantion boards around
-*Availability of the most powerful software applications around

for much less than $3000 (as the 386 box I can get now)?
That is what I would call power without the price.
I wish they could do that. But how realistic is it to expect it?

/* acf5:comp.sys.atari.st / ATT3B@UCONNVM.BITNET (Martin Stein) / 2:57 pm Nov 5, 1989 */

> The biggest problem, however, of the TT is the price.
> ... So the TT will have
> a hard stand against '386 Unix machines, which are down to about $4000 *now*.
> In the newest Byte are adds for ~$5000 '486 machines! And that price will
> get lower, too.

You can get a 386 Unix box with hard disc and monochrome graphics monitor
for less than $2000 *NOW*. And 8 expantion slots.

A friend of mine got a 386 box with 4Meg Ram 800x600x16clours VGa
and 71Mb 18ms hard disk two floppies (1.2M and 1.44M) etc. for $3000.

You use unix for your hacking and some MSDOS compatibility windows
for standard applications and other powerful software developed
for that silly chip which calls itself a microprocessor.

Nobody has mentioned the amazingly low cost of extentions of a 386 box.
A hard disk, a floppy, I/O ports, modems, Memory...
Who can beat those prices?
****

Closer to the point:

Can Atari give a Unix box with
- Many expantion slots
- Lots of memory
- High res color monitor
- Fast and big hard disk
- High Density floppies, I/O ports etc.
-*Availability of the cheapest expantion boards around
-*Availability of the most powerful software applications around
BTW: Intel supports a binary standard for Unix V.4 running on 386

for much less than $3000 (as the 386 box I can get now)?
That is what I would call power without the price.
I wish they could do that. But how realistic is it to expect it?

2506. Re: Trying to read an Atari St Gem-Dos disk on a Mac SE using FD/HD

Newsgroup: comp.sys.atari.st
Date: 1989-11-07 00:48:00 UTC
From: Don.Weeks@p0.f3107.n124.z1.FIDONET.ORG
Message-ID: <2624.25581EA5@tlsi.FIDONET.ORG>
Source record: 247485

Peter,
I do this all the time. SE/30->Atari and back. I do have to preformat
the disks in DOS format before hand. In this way both the MAC and ST
can read/write the disks. I think that there might be a couple of
public domain programs that will format the Atari disks with the DOS
directory structure.
Hope this helps.

2508. Re: GEMDOS Extended Argument Spec (LONG)

Newsgroup: comp.sys.atari.st
Date: 1989-11-07 01:00:36 UTC
From: david@bdt.UUCP
Message-ID: <175@bdt.UUCP>
Source record: 247371

Has the new arg spec been tested with many programs yet?

How do they react to the "127" in the command tail? Have
any choked on it yet?

Since none of the current shells that I know of support the
127 validation scheme, if I enable it now in programs, they
will no longer pick up arguments, even when used with an MWC
format compatible shell. When should we "turn on" this
validation?

Has anyone heard from MWC as to when (if?) they will support
the new method?

From: csrobe@CS.WM.EDU
Message-ID: <8911070143.AA09348@cs.wm.edu>
Source record: 247387

I was looking over the code in your article on the EAS posted in digest
V89 #595 trying to comprehend the method, when I think I discovered
a typo. It is in the while loop that is supposed to "put as much in
the tail as will fit":

```
while ((lentail < 126) && (penvargs < pchildenv))
```

lentail is initialized to 0 above and never changed in the body of
the loop. Given that the tail cannot be longer than 125 bytes, I am
supposing that lentail should either be post-incremented here, or
incremented in the body of the loop? Is this correct?

Thanks,

Source record: 247382

Scott Le Grand writes:
>Hi, what exactly IS Fractal Magic

Well, Fractal Magic is a program that generates color fractal pictures. I have seen it running on a Mac II (I think), and the pictures are magnificent. Fractals are, very roughly, mathmatical models of chaotic behavior. Taking the initial set of one particular kind of fractal, the Mandelbrot set, one would see a symmetrical thingy that looks kind of like three circles. The internal edges of the figure are very colorful, and kind of fuzzy looking. When one selects a small area of this fringe to reevaluate, the resulting picture would be essentially a blowup of the first, but the edges of this picture would be even more colorful and complex. Also, one might find tiny copies of the initial set amongst all this confusion. The basic property of this type of fractal is that one may reevaluate sections of it infinitely many times, and yield infinite variations. That is, the edges of the figure are defined with infinite resolution, but no matter how many times you blow it up, you can still find small copies of the first set. This is probably a very bad description of this phenomena, but for a better one, I would heartily suggest getting the binary called MANDEL from panarthea. It c is the fastest Mandelbrot generator I have ever seen (these types of programs can sometimes take hours to evaluate a section). In addition to the program itself, the author has included a small doc file on the mathmatical formuli he implemented. If you are into assembly, the source code is available from the same place (panarthea).

The full address of panarthea is: archive-server%panarthea@sun.com on the UN*X box I use. Bitnet address may be different.

Yes, the Spectre 128/GCR can use 128K Mac (Plus) ROMs or old 64K Mac ROMs. It is quite stable, at least with 6.0.2 (which I'm currently using). MultiFinder isn't rock solid; it acts pretty strange. The latest release, 6.0.4, contains numerous fixes... maybe it will run better on the Spectre. We'll know if Apple's 7.0 works when it is released. Yes, virtual memory will only be supported on MMU equipped Macintosh systems. The rest really doesn't have any reason to not work with the Spectre.

>2. What facilities for disk access does Spectre GCR support? Can I read files

>make a real Mac look quite cheap!)

The Spectre GCR is the Spectre 128 with Macintosh disk access ability. It will read, write and format Macintosh disks faster than a Macintosh. I've compared the speed side by side... and it's really true.

>3. Are there any differences between the US and UK versions?

I don't think so... I'm not sure.

Well, there is B & C ComputerVision in Santa Clara and San Jose Computer in,
surprise, San Jose. I don't know about Santa Barbara...

>Russ Evans
>c/o British Geological Survey, Edinburgh, UK

The Spectre GCR is a really great product. The only features I can think of
that I would like to see added are:

- Improved MultiFinder stability (is it really just Apple's weird code?)
- Shutdown/restart that works (it is hard keeping average users "ejecting"
hard drive partitions before turning the machine off - ARGH!)
- Selectable Spectre or Macintosh (GCR) disk format while running as a
Macintosh (it only formats Macintosh now)
- Macintosh SCSI device support (using ICD, Supra, etc. host adapter) so we
can use real Macintosh SCSI hardware
- Sound improvements: correct pitch, newer system compatibility, etc.
- Expensive Christmas presents for faithful users :-)

Oh yeah, a fix for my Future Systems GTS-100 drive so it can work with the
GCR would be great! ANYONE have any ideas how I can get this beast to stop
filtering out the high frequencies? (Is that the problem?) It figures that
I own the only 3rd-party drive that does not work with the GCR. At least I
have one drive that works...

that I would like to see added are:

- Improved MultiFinder stability (is it really just Apple's weird code?)
- Shutdown/restart that works (it is hard keeping average users "ejecting"
hard drive partitions before turning the machine off - ARGH!)
- Selectable Spectre or Macintosh (GCR) disk format while running as a
Macintosh (it only formats Macintosh now)
- Macintosh SCSI device support (using ICD, Supra, etc. host adapter) so we
can use real Macintosh SCSI hardware
- Sound improvements: correct pitch, newer system compatibility, etc.
- Expensive Christmas presents for faithful users :-)

Oh yeah, a fix for my Future Systems GTS-100 drive so it can work with the
GCR would be great! ANYONE have any ideas how I can get this beast to stop
filtering out the high frequencies? (Is that the problem?) It figures that
I own one the only 3rd-party drive that does not work with the GCR. At least
I have one drive that works...

I don't really understand why you (and many others) complain about the TT/P. It's just an option for those who can't pay twice the price for the TT/X! You could as well complain that the ST is not as good as the ATW! AND as far as I know, the TT/P has exactly the same graphics capabilities as the TT/X. You can also add as much RAM to the TT/P as to the TT/X (again, I think so).

>

I was also working up to posting a similar query, as I was thinking it would
make sense if we were not all dupilcating each others work.

O.K. I will kick off :

Field:
My main field is in using NMR to measure diffusion and motion induced
relaxation in solids; we have for a number of years also been looking
at NMR imaging in solids.
I also help out other groups, i.e. simulation studies of molecular dynamics.

Software:
Over a number of years, I have written a variety of routines for these;
the ones particularly relating to imaging including various of the standard
surface plots, 3D transformations and projections, stereoscopic pairs, etc.
Currently (well, from time to time) I am doing a set of routines to start
with a 3D volumetric set of data, and generate shaded surface views
of features. (Interesting results so-far, but NOT finished - perhaps now I
have a 4MByte machine ...).

Languages:
I program in a mix of languages, using each where suitable -
i.e. : Shell, using Sed to fire up a command setup to run Apl (where the
bulk of the array massaging is done), which may call compiled routines
created in perhaps C or Fortran , or do requests on Maple (the
algebraic manipulation language).
Currently I am still tranfering this to the ST; much of the Apl transfered
painlessly (just a simple translator - in Apl of course); still can not afford
a copy of Maple for the ST, and the only copy of Maple 4.2 on the campus is
on a VMS system (any one know how to do an equivalent of piping under VMS ??).

Device Drivers:
In the past I have driven other devices :

- i.e. Sigma graphics, Tek, XY scope, Transient recorder, Epson Colour JX80
but the interest here is in ST screen:
have been slowly implementing a set of windowd graphics for the ST;
- line, shaded+coloured bit map, shaded surface.
Don't have much time for it, but this is where my recent query on
firing up desk acessories came from.

Glossary:
NMR - Nuclear Magnetic Resonance
(NOT high energy physics - actually just uses radio frequencies)
looks at the nuclei precessing in a magnetic field, as a sensitive
probe as to what is happening in the material. (Freq = gamma x Field)

NMR Imaging
Now a routine tool for medicine (Imaging without X rays) - they
look at the water in the body; tissues show up well, bones (they
are solid!) don't. O.K. solids are harder; that is what we do
(no, we can't do whole bodies yet, no we can't do bones well yet
- this is physics research.)

Question:
Any NMR (Diffusion,Imaging) routines you are willing to share ?
(I would have to get an OK on swapping mine).
Any ST graphics or imaging routines ? (as above).

Sorry to write so much

beau webber jbww@ukc.ac.uk

2532. Monitors

Hey,

Anybody out there ever made their own monitor switchbox? I wish
to add a monochrome monitor to my color system, and I am trying to save
as much money as possible. I am also interested in (but probably not
prosperous enough for) interfacing a Muli-sync monitor to my system. I
have seen an Omnimon (sp?) setup like this, and it is very nice. The
color setting yields superior rendition to my color (not by much, but it
is perceivable). The monochrome is not quite as sharp as the Atari mono,
but this is even less perceivable that the color differece. All in all,
probably worth it to rid one of two monitors cluttering up the desk. The
only problem is cost: it is only sold as a monitor/interface package (to
my knowledge). If anyone knows different, or if anyone has built either
a multi-sync interface or a monitor switchbox, I would certainly like to
hear about it.

> -G.M.L-K

Yes, there is a problem:
Probably program 1 will do an exit(2) (or, the GEMDOS counterpart of this
U*IX call) and the rest is not executed.

Besides, some of your programs may go resident -- at this way there will
be multiple copies resident; this may not be what you want.

To do what you want, disassemble the programs, look at these two points,
(simulating exit() by a jmp (probably with saving of SP)), and reassemble.

Klamer.

Netters,

In a vintage (dec 88) issue of ST Action, a british publication, I noticed a piece of software for sale that sounds right up my alley. It is called Trip-a-Tron, and is a "light synthesiser". Basically, a neato moving color graphics creator that can be driven by MIDI signals. It also states that Trip-a-Tron has it's own control language, for programming the demos. I am VERY interested in this package (Trip-a-Tron, FM modulator, and a Kloss Vidio Beam would make a dandy wall-sized distractor at a night club). Does anyone out there have this package? Does it work on US machines (very important)? Is there a used copy I might liberate from some individual? The add states that it is made by Llamasoft.

2535. Looking for notation programs (DMCS, Finale')...

Newsgroup: comp.sys.atari.st
Date: 1989-11-07 14:36:49 UTC
From: jtn@zodiac.ADS.COM
Message-ID: <9715@zodiac.ADS.COM>
Source record: 247320
Cross-posted to: rec.music.makers,rec.music.synth,comp.sys.atari.st,comp.sys.mac

Hello everyone. I'm thinking seriously about buying a music notation package that will speed up the process of well putting musical ideas down in standard notation. The two programs I am most familiar with are Finale' (sexy) and DMCS (Deluxe Music Construction Kit). Both run on the Mac and I don't think that either runs on the Atari. Also I have a Mac at work so a Mac based package is probably what I'll want and the two above programs look like the best around.

I'd appreciate opinions from others out there however. Finale' is particulary expensive so I'll most likely opt for DMCS. That assumes that I can just connect up a MIDI keyboard (or use Mac keyboard equivelents) and type individual parts in and expect DMCS to automagically provide all of the notation necessary.

Is there anything ou there on the Atari that comes close to either of these two programs? It will have to support postscript printing. I like nice high-quality output on 11x14 landscape mode paper... suitable for organists.

Thanks for listening. Looking forward to your recommendations.

2536. Printing Files.

Newsgroup: comp.sys.atari.st
Date: 1989-11-07 15:06:00 UTC
From: AMEIJ@vax.oxford.ac.UK
Message-ID: <8911080819.AA09086@ucbvax.Berkeley.EDU>
Source record: 247336

Dear Gang,

Does anyone out there know a good way of printing files (ie transferring a file to a printer) from within a program, in C? The file is an HPLJ+ binary file, from DVI2HP, so it has lots of font downloading and is therefore as unpleasant as they come...

fopen/fgetc/fputc/fclose keeps falling over (it sees end of files in the input) as does open/_read/_write/close.

Advice and particularly examples would be much appreciated. Is there a way of calling the Gem/Tos routine which does printing, 'cos clicking on the icon and choosing Print works a treat?

Thank 'ee, people.

2537. Atari Support -- a different perspective

Newsgroup: comp.sys.atari.st
Date: 1989-11-07 15:15:30 UTC
From: csrobe@cs.wm.edu
Message-ID: <8911071515.AA11262@cs.wm.edu>
Source record: 247330

We have all seen the moaning and groaning about Atari's support that has been taking up net bandwidth. I will be the first to agree that Atari's delivery record has left me feeling lacking, but I would like to accentuate a positive point. If it had not been for this network in general and Atari employees like Allan Pratt, Ken Badertscher, et al. clearing up rumors and providing solutions, my view of Atari and the ST would be quiet different.

As it stands, I am willing to pay the $100 (when I get it) for Rainbow-TOS and I am even considering the TT/X down the road (I am a diehard Unix nut). Don't get me wrong, I have my share of gripes with Atari, its just that support from people-in-the-know like these have muted the effects. In the long run, what will decide if I stay with Atari products is how the rest of the company comes around. I'm sure it is no revelation when I say that I expect reasonably priced products, a supportive dealer network, and expandability.

Atari has given me a powerful machine (in its day) at a reasonable price that has served me for over 4 years. The market has changed since then and users demand more -- hopefully, the TT/X is Atari's answer to that demand.

To keep from wasting more bandwidth, I want to re-iterate that Atari's online/network presence has mad a difference with this customer and I wish to thank them for that. I hope that Atari sees the importance in such user contact and maintains them as we see the new products hit the streets.

cheers,

Dalnefre' objects to Atari's statement on extended argument passing, and gives some concrete reasons. They are mostly the kind of situations that can be expected to arise when a standard is imposed on previously chaotic practices. The objections to alternatives were discussed months ago. The new standard, if adhered to, seems to be adequate. For now, while we may have occasion to Pexec programs which never heard of the standard, it may be desirable to have an option in such shells to inhibit aggressive behavior like sorting the child's environment. Time should take care of the rest.
Now how about a standard for desk accessories to report what system resources they hold (windows, memory blocks, file handles, menu slots, etc)?

In article <810015@hpnmdla.HP.COM> glenb@hpnmdla.HP.COM (Glen Baker) writes:
>I've got a friend here who is interested in obtaining a PD CAD program.

I would much rather see requests in this forum phrased more on the order of "I've got a friend here who is interested in obtaining a CAD program. Can anyone make a recommendation?"

While Public Domain programs are very nice (and my own disk archives are fairly full of once-used or "perhaps sometime I'll use it" PD software), the problem becomes this:

Everyone will use the [presumably] less efficient PD program and not bother to consider the [usually] low cost commercial software available for the ST.

It would be more useful to me, personally, to know the relative merits of -- for instance -- DynaCADD, rather than to hear about the possible PD programs which are also available. [Though I wouldn't mind comparisons of PD/commercial programs...]

-- David Paschall-Zimbel

The above does not apply, of course, to the unique telecommunications program known as Uniterm, which is, by far, the most USEFUL publicly available terminal emulator for any personal computer I've come across!

>pull down menus or key commands. Currently, the IBM and Amiga versions
>don't allow this without optional third party add-ons.

The Amiga version has _ALWAYS_ supported pull-down menus and key equivalents.
No third party product is necessary. Please don't confuse Amigas and
IBM's (ever! :-)).

Desk-accessories are a concept needed on NON-MULTITASKING systems only.
Essentially, a desk-accessory is a "generally small" program that
agrees to abide by a few more restrictions than a full program, in exchange
for being able to co-exist (i.e. take over from, and then return to) a
"full" application. Since day one, the Amiga has multitasked, meaning
that in general any combination of programs may be run together (memory
permitting) without any special code required. In other words, an Amiga
owner can run anything (paint programs, spreadsheets, databases, etc.)
while WordPerfect is up. In fact, I can run a ray-tracing in the background
while I am writing in WordPerfect, without ever having to suspend one
or the other.

Not a flame: Both the ST and Amiga suffer from an abundance of misinformation.
Let's try to keep the level of incorrect assumptions down in our respective
communities.

2544. Memory Partitioners: Please Advise

Newsgroup: comp.sys.atari.st
Date: 1989-11-07 17:45:55 UTC
From: rona@hpdml93.HP.COM
Message-ID: <480033@hpdml93.HP.COM>
Source record: 247318

Since upgrading my 1040 ST to 4 megs, I've been thinking about getting a memory partitioner to take advantage of the increased power. I was wondering if anyone could advise me.

After reading the June '89 review in START I got the impression that Juggler II was the most bullet-proof and that Revolver was the most full featured. Bullet-proof is an especially appealing description for any kind of program but Juggler II seems to lack some features that would be most useful. According to START:

1. Juggler II demands that all partitions be the same size. Since 1 meg is occasionally inadequate, that probably means I'll be forced to have a pair of 2 meg partitions. It would be far more useful to have partitions of 2,1 and 1 meg since 1 meg is adequate 90% of the time.

2. Juggler II seems to lack the feature of saving the entire partition to a file. This could be really handy for programs that take a long time to load like PageStream. Revolver allows you to save the partition in a highly compressed format.

START's review of Revolver pointed out a couple of flaws but the program was certainly more full featured.

I recently read somewhere that there is a new version of Juggler. Does anyone know if they've addressed either of the shortcomings I mentioned?

Also, do any of you use these programs? What do you think?

If I don't hear from anyone I'll probably go with Revolver.

Thanks for your support,

Ron Abramson

Quite some time ago, Allan Pratt posted the following:

Is your accessory still in the root of your boot device? If so, I would suspect it. Try booting your system without the hard disk. Turn off your system and your hard disk, unplug the hard disk from the ST's DMA port, and turn on your ST. If it works fine, it's probably software.

Here's how to remove problem accessories and AUTO folder programs:

Turn off your ST, plug your hard disk in, and turn the hard disk on. Put the disk called BOOT DISK in Drive A:. Now turn on your ST, and when the Drive A: light comes on, press and hold the "Alternate" key. This will prevent the hard disk boot sequence. Don't let go until after the hard disk light has flickered once. The hard disk will still activate, because AHDI.PRG is in the AUTO folder of the BOOT DISK. If all goes well, you'll see the Desktop and Drive C: and you'll be able to move the mouse. Remove the offending accessory from Drive C: and reboot. Back to the drawing board.

I should have mentioned: one easy way to cause reboots is for a desk accessory to cause a bus error, address error, or anything that gives bombs. Bombs make GEMDOS terminate the program currently running, which is the Desktop if you haven't started anything else. When the Desktop terminates, the system reboots (because things are obviously very badly screwed up).

END OF ALLAN'S POST

This technique has saved me a couple of times. Thanks Allan!

No.
The VME BUS is pretty hard to handle, since it is kind of a multimaster
BUS.
It does not make sense to build a 32-bit parallel port card for VME. An
Eternet controller would make sense.

2548. Re: TT vs 386 boxes and Apples...

Newsgroup: comp.sys.atari.st
Date: 1989-11-07 19:03:56 UTC
From: me@dude.pcs.com
Message-ID: <ME.89Nov7190356@dude.pcs.com>
Source record: 247308

>Do refer to the TT as nonstandard?
>Is UNIX not a standard?!?! What about all the ST programs there are??

Yes, the TT is non-standard. While it has a VME card slot, the rest of
the system is non-standard. Atari Corp would have to obtain a VERY large
market share before it could be considered a "standard".. this is not going
to happen. UNIX _is_ a standard, but Atari has already announced that UNIX
will _not_ be shipped with the first TTs. With their track record of
"followup", I would not call a promise of UNIX a "standard".

ST programs are by definition "non-standard" because they run on the
"non-standard" ST (in the same way Amiga is "non-standard" and now CP/M
and Apple II have become).

Ah, come on, gimme a break ! I'm sick of reading statements like these.
What the hell is a standard concerning computers ? Does it have to be MSDOS
compatible to be standard? Or what ?

I don't buy a computer because zillions of other people have a compatible
model, or because I can connect it to my microwave oven and the video recorder
at the same time using this wonderful extension card; I buy it because I want
to do certain things with it. So, I need hardware that provides me with the
performance and software that does the job, at the lowest possible price.

For example, if I have to calculate the expansion of a supernova I propably
won't use a PC, even if I could run hundrets of great word processors on
the same machine just because my simulation would take some years then.

On the other hand, if I don't need a specific program, but just want to do
text and programming and playing, I don't care if the hardware is compatible
to the rest of the world if I get good programs for the job.

I'm writing this article on a PCS workstation. You propably have never heard
of us and will never see one of our machines outside europe simply because
we are to small and unimportant in the US to sell anything there.
So my machine is really non-standard in your terms.

But it has one of the fastest microprocessors you can get these days (No, sorry
a MIPS processor doesn't run MSDOS without emulation, you even can't plug in
these nifty PC cards 'cause we have no PC or AT bus), a nice big 70 HZ graphics
display and I have all applications available I need to port X-Servers, debug
them, write documentation, read news and so on.

What I want to say is: If you don't like the features of your ST any longer
and don't like the TT 'cause you "just" can run all thep properly written
ST software, go ahead, buy something "standard" like a no-name 386, or, if you
have the money a Mac II and start whining about these machines.

You'll always have problems with the computer you have, be it too much money you have to spend, or no hardware support and so on.

Just to provide some realistic examples:
- unix-like make programs sometimes need such arguments and they will
also probably sort the environment to pass it over to their childs
- C-preprocessors also like "-DMACRO=something"
- less uses "-PM=promptspec"

>world. Both the Mac versions (version 1.xxx) and ST versions allow real
>pull down menus or key commands. Currently, the IBM and Amiga versions
>don't allow this without optional third party add-ons.
Wrong. 1) The Amiga is multitasking. It does not require anything similar
to a desk accessory; simply start a second programme. It will load into memory
and be running _at the same time_ as WP is running; _all_ programmes work
this way on _any_ multitasking OS; even OS/2 :-) 2) The Amiga version of
WP most certainly has pull-down menus, file requesters, etc; I use them all
the time, having never really liked WP's key choices for its commands.

Luckily, there is a way to get at FTP-servers from BITNET. Send mail
to BITFTP@PUCC.BITNET with the command HELP in the first line of the
body of the text. A warning: BITFTP delivers the files it retreives
from the FTP - servers in NETDATA - format (IBM's own), so that there
is probably little use requesting files from outside BITNET...

I agree.

There is one thing I like to see, too: can somebody tell the net
what FTP servers are available for ATARI ST stuff and in which
directories it is stored (using BITFTP is not exactly interactive,
as you have to use mail to get there)? I'm sure many people would
appreciate that.

Since software has to be written to hit the widest possible market
possible, only a very VERY foolish developer would write a program that
can't run on anything but an STE. Most STE specific features may be
emulated in software and thus hit a much larger market for a very small
additional effort.

>>What I'm aiming at is: Will TT-user have the possibility of using programs

> the horizontal scroll...

Any program written to use the "STE horizontal scroll" will probably be
written to also have a comperable software scroll when run on non-STE
machines...

(Please, no flames about the sound or extended graphics not being
emulatable in SW. Reasonable equivalents can be developed for non-STE
hardware and will be for any programs that are going to be anything more
than interesting very-small-market programs...)

A few days ago, I posted a message concerning some stuff at our local
Atari dealer, Software House.

Apparently, they did not like some of the things I said about their
policies concerning both TOS 1.4 and upgrading PageStream disks.

SO, thought it wise to clarify my position a bit:

Any comments I made were meant as constructive criticism, not slander.
If the comments were taken as such, I apologize.

I do know that at least one employee has possible access to Usenet, so
if he would like to state his store's position on these subjects, I'm
sure many people in Net-land would like to hear them.

Finally, my comments are just that, MY comments, and NOT representative
of our users group, ACORN.

I was informed that the increase in the ROM price was to offset the $100
phone bill they ran up from calling Atari to get the ROMS. While I
can somewhat understand this, I do not agree with this policy.

My mouth is now shut (but not for long). :^O <- uh oh, its open
again!

> more slots etc... but, I am not necessarily looking for a "deal".
> Again, you _sometimes_ get what you pay for. At this point, I
> am willing to PAY for it.

Well, I for one DON'T HAVE ENOUGH MONEY for a TT/X. Not only that, but I'm unlikely to need to plug _anything_ into that VME slot. In fact, I'll probably only use SCSI, parallel, serial, MIDI and SIMM ports. That's it. I need a faster machine with more memory, and I'd prefer not to throw out my significant investment in software! I APPRECIATE Atari's efforts to produce a machine that I can afford (with a lot of scrimping and saving)!

THANK YOU Atari. It appears to me that you've been listening to what people want. What have been the main complaints against the ST hardware?

1) Memory not expandable: Taken care of in TT
2) ACSI instead of SCSI: Taken care of, means cheaper disk drives
3) Only one serial port: Taken care of
4) Not expandable enough: Hey, at least there's a slot, and it's a STANDARD!

What have been complaints about other companies' upgraded computers?

1) Not compatible enough: TT has hardware registers in the same places
2) Have to buy new peripherals: The ACSI port is still there!
Don't know about monitor.

People want more slots. Well, _I_ don't. I can't afford everything everyone might want. I would be quite happy with a TT/P, thank you.

The same people who are asking for Ethernet are defending closed diskless workstations sayin that "I don't need slots, my server has 'em. People at home won't have a server." And people at home won't need Ethernet.

Most of the rest of the complaints are software-oriented. Give Atari time. They have said unofficially, with no commitment to a target release date that there will eventually be a multitasking TOS. Someday. Not tomorrow. Unix should be available sooner.

That's it. I had to blow off some steam after reading 30 '386 commercials.

> a hard stand against '386 Unix machines, which are down to about $4000 *now*.
> In the newest Byte are adds for ~$5000 '486 machines! And that price will
> get lower, too.

You can get a 386 Unix box with hard disc and monochrome graphics monitor
for less than $2000 *NOW*. And 8 expantion slots.

A friend of mine got a 386 box with 4Meg Ram 800x600x16clours VGa
and 71Mb 18ms hard disk two floppies (1.2M and 1.44M) etc. for $3000.

You use unix for your hacking and some MSDOS compatibility windows
for standard applications and other powerful software developed
for that silly chip which calls itself a microprocessor.

Also, Nobody has mentioned the amazingly low cost of extentions of a 386 box.
A hard disk, a floppy, I/O ports, modems, Memory...
Who can beat those prices?
****

Closer to the point:

Can Atari give a Unix box with
- Many expantion slots
- Lots of memory
- High res color monitor
- Fast and big hard disk
- High Density floppies, I/O ports etc.
-*Availability of the cheapest expantion boards around
-*Availability of the most powerful software applications around
BTW: Intel supports a binary standard for Unix V.4 running on 386

for much less than $3000 (as the 386 box I can get now)?
That is what I would call power without the price.
I wish they could do that. But how realistic is it to expect it?

In what aspect is a TT better than a 386 unix box? As a whole?

2561. *** ATARI PRESS RELEASE ***

Newsgroup: comp.sys.atari.st
Date: 1989-11-08 01:48:01 UTC
From: 4224_5132@uwovax.uwo.ca
Message-ID: <4061.25573f82@uwovax.uwo.ca>
Source record: 247333

It seems apropo to repost the Atari News Release I submitted at an earlier date, hopefully this will clear up some of the 'rumors' flying around about the TT. Also, I would like to personally thank Ken Badertscher of Atari Corp for his input lately in answering numerous questions from us users.

Anyways...

Taken from Z*net newswire, August 1989...

"Atari Newswire Update

Press release from Atari: To all Atari Owners:

....

Premiering at the Dusseldorf Atari Fair, the TT, with the Motorola MC68030 processor, moves the ST family into the 32 bit realm, achieving a significant increase in computing power with full TOS compatibility. Our goal for the TT was to design an expandable computer that would combine ST compatibility with superior resolution, more computing power, and improved sound generating abilities. At the heart of the TT is a 16MHz MC68030 processor, which allows a high degree of 68000 compatability, while operating at a higher clock speed and providing streamlined internal operations which make it even faster. The 68030 has built in 256 byte instruction and data caches, and an internal Memory Management Unit. Next to it on the board is a socket for an optional math coprocessor (MC68881/MC68882). Memory on the TT is a full 32 bits wide, both the ST RAM which is shared by the video logic, and TT RAM which is not shared. These factors combine to result in a memory bandwidth that is four times greater and program execution speeds up to 17 times faster than on the ST.

In both hardware and software, the TT is compatible with the ST. All hard-ware registers are in the same location as they are on the ST. The ST video modes work the same way on both TT and ST, because they are organized in memory the same way on both machines. Most important for ST compatability is the operating system in the TT: TOS. With TOS as the TT operating system, existing programs can automatically use the improved resolutions of the new video modes, as well as the larger colour palette, without any changing of the software. All this ST compatability has the obvious benefit of allowing TT owners to take advantage of the large and growing base of ST software.

In addition to the three ST video modes, the TT has two new colour video modes available on it VGA monitor: 640 horizontal by 480 vertical resolution with 16 colours, 320 horizontal by 480 vertical with 256 colours. With a high resolution monochrome monitor, a 1280 by 960 monochrome mode is available. All the colour modes use a new, expanded 4096 colour palette which is also available in the ST modes. Even ST monochrome (640x400) is actually a two

colour mode on TT; we call it "duochrome."

The improved sound system uses stereo 8-bit PCM (Pulse Code Modulation). This allows the TT to function as a digital tape player. The hardware also includes an automatic variable low pass filter, a stereo balance control and bass and treble tone controls. This sound is mixed through the internal speaker as well as being output via two RCA phono jacks located on the back of the machine. These features, combined with the high powered computing capbilities of the 16 MHz 68030 allow the TT to produce a wide range of high quality sounds. In keeping with the design goal of expandability, the TT has all of the ports familiar from the ST: MIDI, parallel, serial, and the Atari ACSI DMA port (for Atari hard disks, laser printers or CD-ROM). The TT also includes a 25 pin SCSI port. One of the four TT serial ports can be configured as an industry standard medium speed SDLC network port. Of course, the machine also provides an internal speaker, a clock with battery backup, and a Mega ST compatible keyboard with ports for mouse and joystick.

In addition to the expansion capabilities provided by the TT's external interfaces, the TT is expandable internally as well. The housing can hold an internal hard disk and add-in memory cards. These memory cards allow the standard 2 megabyte TT to be expanded to 8 megabytes, or as much as 26 megabytes when 4 Mbit DRAM chips become avaliable.

Another example of internal expandability is the slot for a single standard "Eurocard" style VME card. This slot allows use of any of the large number of existing VME expansion cards. Some of the VME expansion options currently available include memory expansion, Earthnet and other network boards, coprocessors, graphics boards, and data aquisition (A/D and D/A converters). Already planned for TT VME expansion are an Earthnet board for networking, I/O port expansion, and graphic extensions.

The work-station like capabilities of the TT will be complemented by an optional industry standard operating system. UNIX system V is being ported for the TT. Also available will be X windows as well as an X windows based graphic user interface, giving TT owners all the benefit of UNIX without all of the difficulties usually encountered. Here is a listing of TT specifications:

+ ST compatible operating system, giving TT an extensive software library

+ ST compatible hardware, including all ST interface ports

+ Three new graphics modes: 1280 x 640 pixels high resolution monochrome, 640 x 480 pixels with 16 colours, and 320 x 480 pixels with 256 colours

+ All colour graphics modes use an expanded 4096 colour palette

+ 16 MHz Motorola MC 68030 processor

+ Socket for optional MC68881/MC68882 math coprocessor

+ DMA with built in SCSI and ASCI ports

+ Two serial ports, expandable to four ports

+ Parallel interface

+ Detachable keyboard + Internal "Eurocard" VME socket (A24/D16)

+ Internal hard disk option

+ 8 bit stereo PCM sound

+ 2 Mbytes RAM, expandable to 8 Mbytes (26 Mbytes with 4 Mb DRAM)

+ Real time clock with battery backup

+ Network capable hardware

The Atari TT continues the Atari tradition of delivering Power Without The Price! We reserve the right to change technical specifications without notice. UNIX is a registered trademark of AT&T.

August, 1989, Atari Corporation, 1196 Borregas Ave., Sunnyvale, CA 94086, (408)745-2000"

This article appears exactly as it was in Z*net, August 1989.
The '....' indicator represents material omitted on Atari's release of Rainbow TOS. It is also availiable on request.
All spelling errors are my own.

I posted this a few weeks ago but absolutely NOBODY replied to it.
According to an article a couple of months ago in ST-World, there was a
review of the new TT computers, and in the article they said that only
the TOWER model of the TT would ever be able to run UNIX, while the other
version is NOT going to support UNIX. Does anyone know WHY the two TT
computers are not software compatible?

This sounds like a typical "gotcha" I'd expect from other computer companies
but not Atari!

someone please clarify this!

Source record: 247332

Here is some more news on the TT...

From Z*net Newswire (November 1989)

" ZNET EUROPEAN NEWSWIRE
(Ed. note: Please be aware that the following is a EUROPEAN REPORT
and SOFTWARE releases discussed here are NOT necessarily available in the
United States, now or ever!)

....

---> Early 1990 is the date set for the UK release of the TT. The TT
(TT030/2), includes a 68030 at 16MHz, 2 MbRAM, 30 Mb Hard Disk, and VGA
standard colour monitor. The resident operating system called TOS030,
will be a variation of the current TOS1.4. Not included is the Unix
multi-tasking operating system or the PC emulator.

---> The 1040 should be phased out during March/April 1990 and replaced
by the once called "ST Plus" or "Enhanced ST", now called 1040STE. The
STE will include 1MbRam, fast hardware scrolling, 4096 colour palette,
8-bit stero PCM sound, TOS1.4 operating system, and four SIMM (single in
line memory module) for easy expansion to 4Mb."

All spelling errors are mine. The spelling of colour (in the correct
manner) is also of my doing.

To R. Covert: I refuse to fight with you over this.

I guess this answers the question of which TOS the STE gets?

Note: By correct manner, I mean Canadian, NOT CP-Style, relax :-)

If i am not mistaken, I believe Ken from Atari confirmed that the first
TT's WILL, in fact, be capable of running UNIX, provided there is sufficient
RAM and a big enough HD. He pointed out that the REPORTING was erroneous,
as is much of such reporting.

In response to the fellow who was interested in terminal programs,
I use a program called ST-TERM, written by Matthew R. Singer.
The version I have is 3.7b. I am not sure if it is the most recent,
but it is not very old.

St-term used to be commercial, and I bought a copy then, but since has
gone public domain, so anyone can take it. It supports an excellent
phone dialer (you can dial numbers in sequence until it gets through to
one of them) , keeps track of passwords and user numbers, baud rates,
etc.
It also supports 10 transfer protocols including SEALINK and ZMODEM.
terminal emulation: vt100 and vt52 ONLY

no gem support, or multitasking, but it is only 72k after "gerpackting",
looks and feels like procomm, and is quite reliable. I like it and have
never had even the remote desire to switch to flash or interlink, like
most of the masses have.

Regarding a question I re-posted about running unix on the non-tower
TT, apparently Atari responded to my first article explaining that
the St-World article which stated UNIX wouldn't run on the this
version of the TT was a MISTAKE. For some reason the reply didn't make
it to my site, so I didn't see it, but Greg pointed it out to me,
so I cancelled the re-posting of my question.

Sorry guys. I hope that'll never happen again. To Atari: if you still
have this message on file, could you send a copy of it to me in e-mail?
thanks!

I have both Flash and Interlink. I think Interlink is slightly
more friendly because of its point and shoot capabilities, but Flash is
a more tested and reliable program from what I can tell. I got Interlink
because it got such rave reviews, but when I found the vt100 and vt52
emulations wouldn't work properly with Unix on the Sequent Balance, I was
forced to abandon Interlink as a loss. I am now using the vt100 emulation
"mode ansi" on Flash, and it works fine with "vi" (which I am using to
write this note). WithInterlink, I lost my precious arrow curser movement
and my PF keys with the best setup I could find. (Screwed up results with
the others). If I recal correctly, the Interlink vt100 in ANSI mode resulted
in nothing being shown.
This made Interlink unsatisfactory for use in dialing into a Unix
system.

I don't know of a Common Lisp, but StonyBrook Prolog looks like it's going to port to the ST. I have done some preliminary work but am passing the job over to Andrew Stevens at Edinburgh U. (he was planning to do it anyway).

You *could* try the Spectre GCR + Mac s/w route, but it could be an expensive failure.

> David Megginson, Centre for Medieval Studies, Toronto

Fascinating, I didn't know that Canada retained the British spelling of "centre" -- or are you a Brit?

Sorry that this was posted, not mailed, I wasn't able to get mail to you last time I tried --- are you sure that you exist? :-)

At my workplace, there are little dominions of microcomputing. One building is dominated by Atari STs, others are dominated by PCs, others have nice mixes of Macs, STs and PCs and one in particular is the mecca for Mac enthusiasts. Nestled neatly in the Mac mecca are 4 1040STs that sit as front ends to a VAX based graphics system (I/O is via UNITERM).

I trundled by and plugged Spectre GCR into one of the STs and lo and behold, Mac users started drifting in with floppies trying to find a Mac application that would not run on the lowly (that's their opinion, not mine) ST. After a full day on disk-in, disk-out, click-click and ooo-ahs, Mac users were finally convinced that YES, Spectre GCR is for real and YES it does a great job of running MacWare (Gee!, the screen looks so much bigger!).

Having seen VersTerm Pro, Cricket Draw and Graph, MacDraw II, MacDraft, Word 4.0, Excel 1.5, FileMaker +, MicroSoft Chart, StatWorks, SuperPaint, etc. run on the ST, most Mac users agreed that an ST with GCR would fit in nicely with a Mac environment.

I use Notator on the ST (I am not aware that it is available for other
machines).
I have used many ST sequencers (though not extensively) and I like Notatpr
the best. I really like the ability to Edit my MIDI stream using music
notation instead of some arcane grid and what not. It also is very powerful
in terms of the capability to arrange your music, to record/dub/punch in etc.

As was pointed out in a keyboard review, it does seem to be the Porche
or Ferrari of
Sequencing packages.

There are also several hardware add-ons that work with it, including Unitor
(which gives 2 more MIDI outs, an extra IN or too and SMPTE), Export (three
more MIDI outs -- yes Unnitor and Export and ST = 96 independent MIDI
channels),
and Human Touch, that allows external control over tempo, etc.

#1 product

With the arrival of European ST magazines in the U.S., a Stateside
STer cannot help but marvel over the ST software and hardware in
Europe. How I wish that our selections of peripherals and programs
could approach that of Europe's.
Many of the European ads offer to sell product internationally
but don't give the procedure: 1) Do we convert $$$ to European currency?
2) Is there an airmail option rather than ocean mail? 3) Is there an
internation reply coupon option?
Secondly, what about American duty charges?
Finally, why is it that the more polished European ST magazines
are CHEAPER than the U.S. magazines? Example, the U.S. STart Magazine
costs $14.95 with diskette. The British ST magazine, Atari ST User
costs $7.97 with diskette from my dealer. Even with duty, if charged,
the cost to me is 50% less than the American magazine with diskette.
I'd assume that advertising is the key, lowering ST User's cost.
At any rate, it is great seeing European magazines here in the
STates at a regular basis. I only wish that [CENSOR...ATARI BASH...CENSOR]..

writes:
>> does anyone know why xanth's atari directory is empty?
>
> because the people here who would set-up automatic archiving for
> the network all own amigas.

Umm, actually, the ``atari'' directory on xanth isn't for automatic
archiving, but is for ``special'' Atari stuff. From the README:

> /atari Public access to outgoing Atari computer related items.
> <scott@cs.odu.edu>

This directory is Scott's area to put in whatever he wants, not a
space for an automatic archive (which would appear under the /usenet
directory on xanth).

In article <SCOTT.89Nov6161650@oswy.cs.odu.edu> scott@cs.odu.edu (Scott Yelich) writes:
> because the people here who would set-up automatic archiving for
> the network all own amigas.

Scott implies that the ST owners who are in a position to create an
automatic archive on xanth are unwilling to do so (this may be true).
However, Scott's comment shouldn't be interpreted as the Amiga folk
are preventing such an archive (this is not true).

Since the articles in comp.{sources,binaries}.atari.st have the
correct aux headers, it's easy to make xanth start automatic archiving
of that group.

Is it justified? I don't want xanth to become ``yet another archive
site''; it should primarily contain stuff that isn't easily found
elsewhere. If there's already an ftp-reachable automatic archive of
comp.*.atari.st in the US, is another needed? If there's not one
already, then perhaps one is needed...

...tad

PS: By automatic archive, I mean an archive where no person is
involved in placing the files in the archive -- it's all done
directly from the aux headers in the moderator's postings.
This guarantees that the files in the archive have the names the
moderator intended for them, but what the archiver wanted.

2579. Text Based Windows for ST

... stuff deleted ...

And Markku M{enp{{ says:
>I called importer (Teknocomputer) and asked about stacey, TT, STE.
>They said that if there is enough interest they will start importing
>them. Person whom I talked with didn't sound very excited.

The above seen differences are due to importer war here in Finland.
TeknoComputer has a contract with Atari Sweden for an import licence
to be ended in -90. But last year (-88) wasn't too succesful for them
and >90% of the personnel left and formed last spring a new company;
X-Computer. Now the TeknoComputer has replaced its lost staff and has
continued marketing Atari.

But! The new X-Computer had contacted Atari Corp. USA and made a deal
with them concerning the exclusive import rights. So they claim they're
the One and Only Importer, but so does TeknoComputer.

This is just the basic outline of the story, details omitted.
Anyway, the situation here in Finland is far from clear.
I just wish these differences could be solved and instead of
fighting each other, the Atari minded ppl here in Finland could
start *marketing* Atari and stop Finland turning into Amiga
country.

Opening the file for binary will fix the premature end of file problem and
allow the correct data to be sent to the printer.
source = fopen("file.ext", "rb");
printer = fopen("PRN:", "wb");
Now just use fgetc() and fputc() to move the data from "source" to "printer".

From: glenb@hpnmdla.HP.COM
Message-ID: <810016@hpnmdla.HP.COM>
Source record: 247272

>Everyone will use the [presumably] less efficient PD program and not bother to
>consider the [usually] low cost commercial software available for the ST.

Hmm...I guess that the first response I have to this point is "so?..."
Personally I see no reason at all to user commercial software if there is
PD software that fills my need. Quite often, however, I find that if the
need is important enough I am unwilling to use PD stuff due to the inherent
lack of support. As an example, If I were using a CAD system to layout
landscaping for my yard or to make construction plans for a bookshelf I
would look for something in the public domain. However, if I were to
be planning on using a CAD system to design parts for my manufacturing
system I wouldn't even consider PD stuff.

Obviously, in many cases, the intended application strongly dictates the
choice of PD or commercial code.

>Though I wouldn't mind comparisons of PD/commercial programs...]

I agree! This is exactly the kind of information that would help people
decide whether or not they should be spending money on a commercial
package.

2583. GCC or Sozobon in magazines

Newsgroup: comp.sys.atari.st
Date: 1989-11-08 17:02:49 UTC
From: mj@myrias.com
Message-ID: <626547770.17206@myrias.com>
Source record: 247347

This message is posted on behalf of Johann Ruegg. Please direct
all your responses to him and NOT to me. --mj@myrias.COM

>>>>>>>>>>>>>>>>>>> cut here >>>>>>>>>>>>>>>>>>>

Now that the free compilers GCC and Sozobon have been out for a while,
and are being used by thousands of satisfied customers, I have been
wondering why I have never seen either one mentioned in an ST oriented
magazine here in the US. Perhaps the editors don't use C. Perhaps they
already have free copies of the commercial compilers and don't feel any
desire to try a PD compiler. Perhaps no one is really using GCC or Sozobon
and I am misled (in which case there's no reason to keep improving them :-)).

Anyway, if anyone has ever seen a review or even a mention of GCC or Sozobon
in a magazine, either in the US or anywhere else in the wide world,
please send me a short mail message. A summary of what was said
would be nice too.

From article <5440075@hplsla.HP.COM>, by andyc@hplsla.HP.COM (Andy Cassino):
>
> Does anyone have advice about what may be the problem?
>

One problem can come up if you switched from a two chip to a six chip ROM set. The ST runs right at (or above...) the upper margins of the drive capability of some of the buffer chips. If you happened to have weak buffer chips (particularly the two 74ls373 chips) or a weak memory controller chip (the MMU; chips stamped with "imp" especially are getting a reputation for causing problems), the system may start having problems. I.e. while it may run fine with a two chip ROM set, it may have problems with a six chip set or with something plugged into the cartridge port.

Messages from James Allen (of FAST Technologies) on Genie have recommended replacing 74ls373 chips with 74as373 chips, and if you still have problems, start swapping MMU chips (especially if you have one labeled "imp").

2585. Re: GEM help needed

Newsgroup: comp.sys.atari.st
Date: 1989-11-08 17:49:00 UTC
From: hedger@inmet.inmet.com
Message-ID: <30200012@inmet>
Source record: 247349

I just got off of the phone with Mark Williams tech support. No help.
They say that vsf_color just calls the ROM BIOS.

This is driving me crazy! Does anyone out there have any ideas ?
The interesting thing is that this program works in all aspects
except this vsf_color function. I am using a color monitor in medium resolution.
. I have interrogated the work_out[] array created when v_opnvwrk() was
issued and the bits pertaining to color are all set as I would expect.

Even though the limited examples I have of this vsf_color function being used
seem pretty straightforward, I get the sneaky suspicion that there is some
other 'setup' stuff I need to do to the virtual workstation or the
actual screen to play with the color stuff....

Oh well, again if anyone can help I would really appreciate it!

2586. 24 bit colour boards for the mega

Newsgroup: comp.sys.atari.st
Date: 1989-11-08 19:25:46 UTC
From: ignac@electro.UUCP
Message-ID: <1166@electro.UUCP>
Source record: 247282

ok. here's a question for all people in atari-land. are there any 24-bit true colour video boards which plug into the mega expansion bus. and if there are, where is it available (probably germany, since everything good seems to come out of that country). address/phone number of the companies would be very desirable, as well as a blurb on the specs of the board.

(the guys here at work want to get a 24 bit true colour still store board for the AT, and then get me to program for it afterwards. i'd much rather do it on the trusty mega st we have here than on a stupid AT)

thanx in advance.

I was not aware that ST TERM had been released into the Public Domain.
As a FoReM ST SysOp, I do know that ST TERM comes ONLY on the FoReM
disk. It is intended to be run from inside of FoReM by the SysOp.

Last I heard, it was NOT Public Domain, but was not commercial either.
I'll check with the other FoReM SysOps I know and see what they say.

Message-ID: <8911090806.AA03780@ucbvax.Berkeley.EDU>
Source record: 247252

About two years ago, JIL CAD was released as PD. Our users' group has it.
It is a VERY sophisticated 2D CAD code. The catch of PD was that the
manual could be purchased for CDN $50. I used it once, some time ago but
I never returned because it was much more than I needed in a drawing pkg.

BTW, JIL stands for Jesus is Lord, no kidding!

Check out ACCUSOFT, BRE or CURRENT NOTES PD libraries to see if they have it.

2591. Re: WordPerfect ST vs. version 5.0

Newsgroup: comp.sys.atari.st

>
> A question was asked regarding how the ST version of WordPerfect compared
>to version 5.0 for other systems: IBM and Amiga.

I'd just like to point out that the Amiga version of WordPerfect is not 5.0,
it is 4.1.X. It seems that both Atari and Amiga markets are being similarly
treated by WP corp. A few months ago WordPerfect announced that development
of WP for the Amiga would cease and all the programmers would be moved to
IBM or Mac products. After a massive mail/email campaign, WordPerfect decided
to continue selling WP for the Amiga as well as keeping a small staff working
on bug fixes and occasional feature upgrades. They stated that 5.0 for the
Amiga was NOT in their plans. Does this sound familiar to people here? I
beleive that this same scenario was played out to you Atari owners.

[...]
> Both the Mac versions (version 1.xxx) and ST versions allow real
>pull down menus or key commands. Currently, the IBM and Amiga versions
>don't allow this without optional third party add-ons.

Amiga WP DOES have menu selections for WP commands as well as the normal
yucky keyboard commands. Are you talking about some other features here?
If so, I'd like to hear about them so we can lobby WP to add this feature
to the Amiga version.

[...]
> Incidentally, the current version is incredibly
>rock solid...

Again, Amiga and Atari owners have a (rare) point of agreement here. The
Amiga version of WP is also a solid, well-maintained product. Thank you
WordPerfect for your efforts to make good products for your smaller markets!

>
>Larry Rymal: |East Texas Atari 68NNNers| <Z4648252@SFAUSTIN.BITNET>

One question: Does Atari WP have the full document display screen? On my IBM
(at work) we use V 5.0, which allows you to get a graphic display of your page
which shows the text in the correct fonts, as well as underlines, bold, italic,
etc. Amiga WP does not have this, but I wish it did. Very handy, and paper-
saving.

2593. Re: archive sites

Newsgroup: comp.sys.atari.st
Date: 1989-11-08 23:48:46 UTC
From: saj@chinet.chi.il.us
Message-ID: <1989Nov8.234846.1453@chinet.chi.il.us>
Source record: 247259

Tad Guy expressed an unwillingness for xanth to be 'just another' archive site for Atari ST stuff. There exist several unique niches to be filled. What exists now is an 'automatic' archive of comp.sources/binaries.atari.st at panarthea which is very well connected, but operates only in mail-response mode, and an ftp-only archive with greater coverage, but in which article names are not guaranteed to match those given by the moderator, at terminator. The obvious unfilled niches are an 'automatic' archive reachable through ftp and a mail-response archive containing the large and/or obscure items now available only from terminator. The uucp and mail-response archive that used to exist on killer seems to have been phased out on attctc (but if you haven't checked them lately, do so: other parts of their collection have expanded wonderfully). Another empty niche is a BBS with an explicit connection to the ST newsgroups (the IBM PC newsgroups have something like that). And however guilty I feel to say it, I'm not volunteering to set up any of these, but there are the opportunities to be a unique resource.
Steve J.

Does this mean A0 always contains a pointer to the basepage on startup?
How about the stack; isn't the basepage put there as well?

From: hedger@inmet.inmet.com
Message-ID: <30200013@inmet>
Source record: 247263

Got it! I am posting this in case anyone else out there gets bitten.
First of all, the main problem was in fact user error. None of the
docs that I had mentioned that when you are in medium resolution you
can only use 4 colors (I knew that), but they also failed to mention
that you can also use only the FIRST four colors.
These are supposed to be 0=black,1=white,2=red, and 3=green.
Not so, in fact 0=black,1=white,2=green and 3=blue. Anything else
returns white. It never occurred to me to just try each color in
order, big mistake it turns out.
Anyway, that's the answer to this problem and I am going to call
Mark Williams and let them know they have what appears to be a
documentation error.

> could run programs from Sun or maybe even Apple.

It's 1989 and UN*X still sucks. Maybe someday it will grow up
and become a real operating system. When it gets a distributed
lock manager and indexed files and asynchronous system traps and...

I'm not interested in an OS that was designed as a word processing
system for secretaries in the Dark Ages of Computing.

> I have heard rumors that Atari is going to buy some strange non-AT&T UNIX
> type OS w/o X Windows.

The X Window System (_not_ "X Windows", there is no such thing) will
run under MANY OSs. It is not, by any means, limited to UN*X. It
runs perfectly well under God's Own Operating System, VMS.

> Especially if the TT/Tower is cheaper
> then a Sun or an Apple Mac A/UX system.

Well, when THEY can get cheaper than a DECstation 3100, please
let me know. And I guarantee you that MIPS processor will eat
the Sun's lunch, let alone a Macintosh...

What a cute idea. Surprised no one else did this before...

>> hearts) start shipping this stuff out of GENIE and into
>> distribution (like Volker has done) or send it to Panarthea. Life
>> would be grand, then.
>I agree.
>

I thought GEnie and Compu$erve restricted distribution of stuff that was uploaded to them... At any rate, using these services costs me real money, while eating up megabytes of disk on the University machines is pretty much free. What's worse, it takes a long long long time to download anything meaningful from GEnie or CI$, which is probably the most discouraging reason for me. (Time is money, connect time to them is Lots of money...}-) I can just ftp straight to disk usually, so no delays there... If I could ftp files off compuserve.com, I'd do it, but otherwise I just don't have the time, and I'd be surprised if anyone else did.

>There is one thing I like to see, too: can somebody tell the net

2601. questions, questions, questions ...

Newsgroup: comp.sys.atari.st
Date: 1989-11-09 03:36:16 UTC
From: figuei@max.sunysb.edu
Message-ID: <3887@sbcs.sunysb.edu>
Source record: 247268

Hi netters! I have some questions which maybe some of you can answer.

(1) I got version 2.0e of UniTerm from terminator.cc.umich.edu, and it comes with some fonts (unifont.arc) which I can't make it to load. According to the readme files it has a new command (loadfont(index,filename)) but whenever I try it it either doesn't do anything or tells me it cannot open the file. Can anybody help me with this? I really hate the system font!

(2) I am in love with GCC but have only 1Meg on my 1040ST, so I am eager to expand its memory. I know many of you have such expansions, so I would really appreciate any informations about this (which brands are available, pros and cons, what speed the ram chips have to be (I guess it's 120ns?), etc.). Related to this, does anybody have any experience with Fast16 or any other accelerator board? I would like to know something more about them.

BTW, I didn't like the floating point routines in GCC so I spend some (not negligible) time writing my own. They are not perfect, probably have many bugs, but if anybody is interested just tell me and I will send him/her the code. But some words of caution: I wrote them (in assembly, of course!) to operate on 80-bits floating point numbers (using some ideas from a BYTE article by Rick Grehan), so the interface with the compiler is a little bit akward (I didn't want to recompile GCC). But I also rewrote the (arithmetic) operations on doubles using my extended version and am using that regularly (and they work fine, although not very fast). I did this because I prefer accuracy over speed (I wouldn't do any VERY intensive computation on a ST!) and got it! I have (not very fast) routines for sqrt, exp, logs, etc, which give me correct answers to 20 decimal digits. Anyway, if anybody is interested just contact me.

Sorry for the length of my letter! It's my second one (I think).

2602. Misc Things

Newsgroup: comp.sys.atari.st
Date: 1989-11-09 04:11:50 UTC
From: dstr012@ucscg.UCSC.EDU
Message-ID: <9682@saturn.ucsc.edu>
Source record: 247269

I have not been on the NET for a long time So I decided to just post
all of my questions at once:

Where can I get the Xformer 2.55?
Does anyone have a list of ST ftp sites?
What is Turbo St 1.6 and where can it be found?
How do I access tha Atari files on the him1 archive?
And lastly, where is the files that were on the SSYX@UCSC.EDU?

Any help will be greatly appreciated, thank you in advance.

Roman Baker

Cross-posted to: misc.wanted,comp.sys.atari.st

I am looking for the a used EZ-RAM II memory expansion board for my 520ST
I am under the impression that it is no longer made.
Please contact me if you have one you'd like to sell.

btw, I need chips too, so we could make it a package deal.
thanks

-Ajay Choudhri

2604. HDX 3.01

Newsgroup: comp.sys.atari.st
Date: 1989-11-09 06:03:46 UTC
From: SYTANG@CSUGREEN.BITNET
Message-ID: <891108225856E11.WKMZ@CSUGREEN.UCC.COLOSTATE.EDU>
Source record: 247275

Hello everyone:
Local BBS has a file called HDX301.ARC which suppose to have the newest Atari
hard drive software HDX 3.01. And the doc. file stated this should be 3.01,
but when run the Installer and look under the Info one get version 3.00.
Is this right? Did Atari forgot to change the version # in the Info?
or someone packed wrong stuffs? What's the date should be for the 3.10?
(Thanks.

From: V053QHYX@UBVMSC.CC.BUFFALO.EDU
Message-ID: <8911100802.AA27567@ucbvax.Berkeley.EDU>
Source record: 247276

Hi, I think I've finally realized how to post a message over the net!
If anyone reads this outside UB please respond. Here's the problem:

I'm taking MOdula-2 in school, we use a compiler from a company called
Metcom on the macintosh. Hateing the macintosh, I decided to D/L a PD
MODULA-2 from anasystems(actually its shareware) After spending 5 days
trying to figure out why my program wasn't working I realized it was the
compiler that had problems with the OpenInput,OpenOutput statements. Can
anyone suggest a Modula compiler either commercial or PD? Does anyone know
anything about the TDI modula-2 compiler?
Thanx alot,
Jeremy Berger

Well I have a friend who bought this ages ago and thought it was going to be great. The sadness of it is that although the author, Jeff Minter, is a very capable programmer he could not document his creation to save his life. His manual dwells long and hard on simple things like the colour palette but skips briefly over the complex waveform generator. Jeff is totally into sheep, goats and llamas and forces this obsession down your throat by placing them all over his custom menus. To exit his file selector click on the sheep saying baa! Having said that you could still play around with it and have a good time with the supplied material for what you describe above. Trying to invent something of your own will surely drive you nuts!

2608. spectre 128 Mac simulator

Newsgroup: comp.sys.atari.st
Date: 1989-11-09 09:51:40 UTC
From: wilko@idca.tds.PHILIPS.nl
Message-ID: <370@wc37.idca.tds.philips.nl>
Source record: 247279

Recently I have seen an Atari ST machine running a Macintosh emulator program called Spectre 128. The version of this program was 1.75. Because I wanted to get more information on this piece of sw, I have tried to email to the author of the program (email address was indicated in a supplied README file which came with the Spectre package). This proved to be a problem because the machines indicated bounced my mail with an unknown addressee error. Probably the author has moved and the README file is too old to contain his new address.

Maybe someone reading this can help me getting the correct email address. Or maybe the programmer himself (herself?) is reading this.

2610. PC-emulators for ST

Newsgroup: comp.sys.atari.st
Date: 1989-11-09 11:25:18 UTC
From: jackin@utacs.UTA.FI
Message-ID: <777@utacs.UTA.FI>
Source record: 247281

I thought I mailed this once allready, but I am not sure
if it got through. Here it is anyway.

In ST-Magazin 11/89 were two PC-emulators compared :
PC-SPEED and SUPERCHARGER.

****

SuperCharger

- NEC V-30 at 8 Mhz
- 512 Kbyte ram (max. 1024 Kb)
- socket for 8087
- CGA-emulation (only this, no herc.)
- MS-DOS 4.01 included (on two 3.5`` disks)
- supports ST-mouse fully
- supports also SLM 804 !
- '' harddisks (AHDI-compatib.)
- connects to DMA (external housing, size of an Atari 3.5'' Drive)
- two DMA-ports (one for ST, the other for HD, SLM etc.)
- reset switch (on the front of housing)
- you can flip between ST/PC via hotkey
- Norton SI 4.2
- price 798 DM (about 380 USD)

Beta Systems Computer AG
Stauenfenstrasse 42
6000 Frankfurt
West-Germany
(tel. 069/1700040)

Reviewers found out that SuperCharger is very compatible. Among tested
programs were dbase 3 +, Flight Simulator 3, all Larrys, 1-2-3, MS-windows,
Norton Utilities 4.0,Turbo-Basic, -Pascal 3.0 & 4.0, -C 1.0, Psion Chess.
All except two games (ChessMaster 2000 and some other) worked.

PC-SPEED

- NEC V-30 at 8 Mhz
- uses ST-ram (1 Meg ST ;704 Kb free ram + 64 Kb EMS)
- no socket for 8087
- CGA, Herc, Olivetti - emulation (with Hyperscreen FULL Herc-screen)
- no MS-DOS included
- supports harddisks (AHDI, ICD - compatib.)
- goes inside ST
- Norton SI 4.0

- price 598 DM (about 326 USD)

Sack Electronic
Bleichstrasse 49
4792 Bad Lippspringe
West-Germany
(tel. 05252/4290)

PC-SPEED runs about the same programs as SuperCharger (MS-windows
failed). It has more trouble with protected programs (mostly games)
because it's floppydisk-driver isn't as good as SpeedCharger's. Mouse
support ain't that good either. But Graphics emulation is better. No
idea how much free ram with 2 Meg, propably no more than with 1 Meg
(they didn't say).

****

Thought you might be interested.
These are availiable in West-Germany now. By the way why don't
you folks in USA get ST-stuff from Europe. There is various ways
to achieve this (mail is one :-). After all I usually buy my
stuff from the USA (and England and Germany).

2613. Memory upgrades, HDs, CPU cases

Newsgroup: comp.sys.atari.st
Date: 1989-11-09 15:45:43 UTC
From: BAILEYS@FSU.BITNET
Message-ID: <89110911304412B.CKBC@RAI.CC.FSU.EDU>
Source record: 247285

I have seen several requests for information about memory upgrades, I thought I would share this with y'all. I received some neato junkmail about a month ago from an outfit in Texas called Tech Specialties. As far as I can tell, they are an ST only group, and they print a damn nice catalog. Offered within are:

1. Various memory upgrades, seperated by different versions of ST models.
2. Clocks.
3. HD kits, in tower, monitor stand, and desktop style cases.
4. CPU cases, in various formats.
5. Misc. stuff, including a drop in upgrade for the Megafile HDs, SCSI adapter, floppys, and extended Keyboard cables of various lengths.

In refference to number 4, these guys are offering an upgrade to 1040's and 520's in which you can get the motherboard and drive put into a METAL case, similar in size to the Mega's (with more room for expansion), and put the keyboard into another case, and connect the two, thus having a sexy two piece computer (an alternative to getting a Mega, if you are so inclined). The keyboard case is roughly the same size as a Mega's, and uses the original keyboard from the 1040/520. Pretty neat!

Another thing I liked was the info printed within the catalog. They did a good job explaining why they designed there stuff the way they did, and I learned quite a bit about both memory boards and HD's from it. There (whoops) Their address is:

Tech Specialties
909 Crosstimbers Street
Houston, TX 77022
Tel: (713) 691-4527/8 Fax: (713) 691-7009

My catalog is dated 02-13-89, hope these guys are still around. I heartiy recommend getting this catalog, just the info it contains is worth a stamp.

Bob Marley

Disclaimer: I am in no way connected with Tech Specialties. I haven't even bought anything from them, but would damn sure like to!

2614. SH204 hard drive

Newsgroup: comp.sys.atari.st
Date: 1989-11-09 15:59:21 UTC

2615. Amiga/ST WordPerfect retraction...

Newsgroup: comp.sys.atari.st
Date: 1989-11-09 16:38:07 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <891109.10380172.003066@SFA.CP6>
Source record: 247287

I earlier wasted some net space regarding the Amiga and ST versions of WordPerfect in which I said that the Amiga version did not support pull down menus and accessories.
My source of information for the Amiga version was from an Amigoid who, I'd guess (a no no for such discussions), probably does not like WordPerfect for the Amiga, and probably doesn't like it for any other system, for that matter. Anyway, the Amiga version has pull down menus and key equivalent commands, just like the Mac and ST.
Regarding accessories for the Mac and ST on WordPerfect as compared to the multi-tasking environment for the Amiga and to a lesser extent, the Mac via Multi-Finder..... Accessories may or may not be multi-tasking, depending upon their function. They may freeze the host program from running or may not freeze it. This applies for both the Mac and the ST.
Of course the Amiga system can run another program, such as a spreadsheet, while in WordPerfect, but this is not the same as the 'handy' collection of accessories located in one convenient area of the menu bar. Of course we STers would love to be able to run the spreadsheet at the same time as WordPerfect without either program freezing, but that just is not the TOS way, no matter how we massage everything via Revolver or the other switchers.
Anyway, before more misconceptions come from this end, WordPerfect for any system, including the ST and the Amiga, is an excellent product from an excellent company. Join the Revolution...if you have WordPerfect, support it! WordPerfect will certainly support you.

2616. Hard Disk Port Info Reqd.

Newsgroup: comp.sys.atari.st
Date: 1989-11-09 16:51:16 UTC
From: anw1@ukc.ac.uk
Message-ID: <2563@gos.ukc.ac.uk>
Source record: 247288

I am in my final year of a computing degree, and therefore I have to undertake a third year project.

My aim is to produce A medium to high quality sound sampler for the Atari ST, by using the Hard disk port for the transfer of data, in and out of the machine.

I seem to be having a problem with actually getting hold of good reference material regarding ACSI, and about the DMAC chip inside the ST.

If anyone knows anything about the above, or anything they think may be useful could they please mail me the details.

Thanks

Adrian

> ... Another empty niche is a BBS with an explicit connection
>to the ST newsgroups (the IBM PC newsgroups have something like that).

Steve, I'm not sure what you mean by "explicit connection." There are a number of public-access Unix sites that carry comp.sys.atari.st, as well as several STadel and Citadel BBSes that carry it. Among the latter are MAST and Class68 in Minnesota, BRASS in upstate New York, The Land in Ohio, Cerebral Cortex in Nova Scotia (I think) and Bitsko's Bar and Grill in Utah. Several of the People-Net nodes also carry it. I think it also may be available on Bix and therefore to the BBS systems that use the Citadel-to-Bix relay program cooked up by Jefferson Software.

The comp.binaries and comp.sources groups are another matter. I currently am feeding both to MAST, but it's a manual process. (My rnews is not yet smart enough to do the job.) Some of the BBSes may get them directly, but I don't know which ones.

(Jim Kershner, can you elaborate on that?)

I have a 520STFM upgraded to 1 meg which ran FALCON just fine until
I installed the six chip TOS 1.4. Now it takes about 20 accesses on
disk two, numerous disk swaps (to send the heads various places ??)
before it'll finish the boot. Quite frustrating.

Any thoughts on installing both versions at once, hardware switch
selectable?

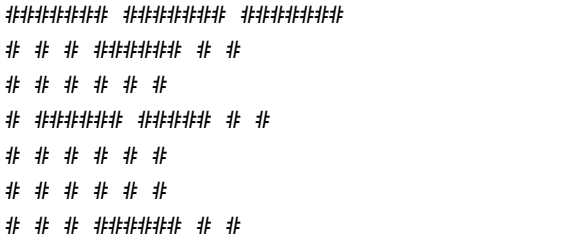
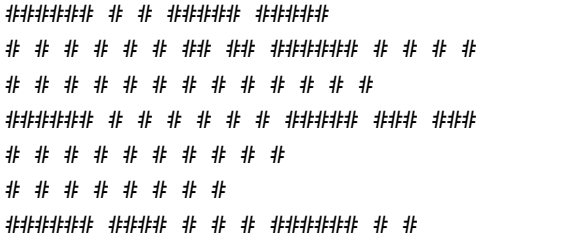
2619. What does the TT Buy me??



Newsgroup: comp.sys.atari.st
Date: 1989-11-09 18:11:40 UTC
From: covertr@force.UUCP
Message-ID: <46bcb82f.14a1f@force.UUCP>
Source record: 247291



Ok, lets try changing the approach to the TT subject. I own a complete Mega ST4 with TOS 1.4, Turbo16, the SLM804 laser printer, and a dual Seagte 65 meg (total = 130 megs) hard drive from ABCO Computers, both Atari monitors (color and monochrome). I have used STs since 1986. I state these facts to show that I am NOT an Atari Basher, rather that I am disappointed with Atari The Company.

Also, I own Calamus and PageStream and Mark Williams C and a host of other EXCELLENT software for the ST.

My point all along has been :

And I mean the TT/Plastic as it is the most likely TT to make it to the USA.

I get the following:

1) GDOS with ALL of its WARTS and faults

2) TOS 1.6, with only single tasking

3) An increase in speed

4) A higher rez color mode (640x480 in 16 colors)

Except for the higher color rez I don't see anything in the TT
that would make me want to dump my investment in my current ST
hardware.

What would make me buy an Atari computer:

1) A FAST CPU, at least a 25 Mhz 68030, with an option to go to
33 Mhz or even 50 Mhz as Motorola releases the faster cpus.

2) ability to change to a 68040 CPU without buying a whole new
computer. That is why I can Atari computers disposable. In order
to upgrade to a different CPU you have to "dispose" of your older
computer.

3) A true multi-tasking, multi-windowing OS. I mean, heck the Amiga
has had multi-tasking since the first A1000 was released.

4) An open buss so that 3rd party vendors can develop boards for the TT.

5) Better Developer support from Atari, with real discounts given to
Developers for Atari hardware.

6) Real color graphics ala the Macintosh. 640x480 in 16 colors is a joke,
and Atari should be ashamed for introducing a new machine with such
limited grpahics?? The TT will be the Atari machine for the early 1990s
and should be better then that!!

7) A replacement for GDOS. Something that uses outline fonts. The Mac system
beats GDOS all the way to the North Pole!! GDOS is such a memory hog that
even 4 megs in my ST is limiting!!

Sure these items all add to the cost of a computer but they should at least
be options. That way a Power User should spend the extra bucks a Home User
wouldn't have to. By the time the 16 Mhz TT/Plastic makes it to the USA
Motorola will be selling 50 Mhz 68030 cpus.

All in all, everything about the TT says if it had been released in Jan 1989
instead of July 1990 it MIGHT have been an acceptable computer. But by the
Summer of 1990, when we can reasonable expect to see the TT on USA shelves,
it will already be outdated by the Amiga A3000, and the Mac IIcx, Mac IIci.

What has happened to Atari Corp?? why can't they design and produce a new
machine as nice as the ST was back in 1985?? The ST beat other computers
hands down in 1985. I wish the TT could do the same in 1990!!

Richard (Tired of Bashing the TT) Covert

2620. ST parts source?

does anybody know of a source for hard-to-find replacement parts
(electronic components, that is...) for Atari equipment (prefereably
in the L.A. or Orange Co. areas)? specifically, a friend of mine needs,
and is having trouble finding, just one part: a capacitor, 2.2uF,
50V non-polar, radial leads, over-sized (to dissipate heat better).
note that this is an odd one; most non-polars are axial, and this is
physically like 4 times bigger than most caps of that value. it was
found ozzing and bubbling in an Atari ST monochrome monitor, near the high
voltage coil. it's obviously some sort of a high-frequency filtering cap
(for the flyback circuit?).
(it was really something to behold... after tracking down 2 blown
voltage regulators, we noticed this capacitor which had blown up. it
spewed it's plastic-like guts all over neighboring components, leaving
a curtain of goop draped between them all. quite visually apealling,
actually. and it smelled like roasting peanuts!)
please e-mail responses, as i dont regularly read this group
(sorry, but i'm a die-hard Amigan :-)

thanx in advance. -matt

```
|I got Interlink
|because it got such rave reviews, but when I found the vt100 and vt52
|emulations wouldn't work properly with Unix on the Sequent Balance, I was
|forced to abandon Interlink as a loss. I am now using the vt100 emulation
|"mode ansi" on Flash, and it works fine with "vi" (which I am using to
|write this note). WithInterlink, I lost my precious arrow curser movement
|and my PF keys with the best setup I could find. (Screwed up results with
|the others). If I recal correctly, the Interlink vt100 in ANSI mode resulted
|in nothing being shown.
| This made Interlink unsatisfactory for use in dialing into a Unix
|system.
|----------

Hmmm, I use Interlink for dialing into Unix systems quite a bit, but I use
the vt52 emulator. The one time I tried the vt100 it didn't work - at all.
But the vt52 does everything I need (including use of vi and arrow keys).
The machines I log into allow me to specify my terminal at login, so I
am satisfied.

Flash is so inexpensive I just might try it, though.

>Put the disk called BOOT DISK in Drive A:. Now turn on your ST, and
>when the Drive A: light comes on, press and hold the "Alternate" key.
...

An even easier method is to use a program like Desk Manager or Superboot
which allows you to select your desk accessories and AUTO programs. Just
make sure that Desk Manager is the very first file in the AUTO folder
and that way it will always load before the crashing TSR or accessory. Then
you just nuke it after the first time it bombs.

Another way to do it, if you're a masochist, is to stick a command line
interpreter in the AUTO folder so you can rename the files manually.

|Chris Mauritz
|----------
```

Well, not all of us are sitting around complaining about Atari, lots of us are using our computers for all the various and sundry (and not so sundry) things we bought them for. Me, I use a computer all day long and a flicker-mundo display is the last thing my eyes need to deal with in the evening. I *really* appreciate Atari's rock solid, crisp mono monitor. (You may infer what I think about some other displays; I'm not interested in a flame war.)

ST magazines? Well, maybe Wall Street is the center of the financial world, but I can walk into any B. Dalton in a suburban shopping mall and buy more ST mags than I want or need.

gl8f@astsun8.astro.Virginia.EDU (Greg Lindahl) writes:
>Right, and a HOME USER with a TT/P doesn't need the things you plug into
>lots of slots. Why should a HOME USER then waste money on slots they won't
>use?

Well, perhaps you and I disagree about what a Home User is :-). I
myself would like a few slots - say three to five - because I like to
hack hardware. And because SCSI isn't The Greatest Thing Since Sliced
Bread to me (to others, it may be, the world is big enough for both
opinions to coexist).

Something I would very much like to have on a VME card is a modem -
not a modem for the phone line (how passe' :-), but a nice quick
56kBaud HDLC radio packet modem. I want it on a card so it can do dma
directly to the buss, and generate interrupts only on frame
boundaries. 8000 character interrupts per second is hard on a machine
that's trying to do other work (like pay attention to the keyboard).

I'd like some uncommitted ttl i/o ports - say about 32 bits worth.
I'd like an ethernet card, and maybe a multiport serial card.
I'd like some a/d and d/a, and maybe a DSP (digital signal processor)
coprocessor board.

Now maybe you can stick all this stuff on SCSI. I don't know, I seem
to remember some rules about a total of 8 targets + initiators. Maybe
that was SCSI-1, and has been relaxed. I'd still feel uncomfortable
building the scsi adaptors, and the targets do need some local
intelligence, don't they? I don't know whether I could make all that
fly, and it would be nice if I could just go straight to the buss
rather than screw around with talking to the scsi controller,
especially for coprocessors.

Anyway, I think I'm a home user. I'll probably go with the TT/X iff I
buy another Atari at all. The TT/P sounds like a fun box for the
right person, if the prices truly are in line. Pricing is pretty soft
right now, though. I wonder if AllanP or KenB could give us a price
range? Probably not ;-). I promise to bitch about the price
regardless [100 :-)].

From: sale5312@fredonia.UUCP
Message-ID: <1669@fredonia.UUCP>
Source record: 247300

I've got many disks with accessories, AUTO programs, etc. Sometimes when I boot up with such a floppy (I'd guess about 10% of the time) I get the computer loading a few of the accessories, but then doing a cold or warm boot in the middle. It's like someone hitting the reset switch during bootup before the GEM Desktop appears.

I use the BICLOCK.PRG program that came with Thunder! to set the time, and sometimes I have to set the clock 3 or 4 times because after setting it, the computer starts over.

I also "follow the rules" (i.e. no more than 6 *.ACC's, only *.PRG files in my AUTO folder, etc.) The main problem occurs with my 1st Word disk, in which I have in my AUTO folder the BICLOCK.PRG and IDLE12.PRG, and my accessories are CALENDAR.ACC, THUNDER.ACC, SIRAM.ACC (ramdisk - not set, and printer spooler - 64K). I've also got 1 Meg so memory might no be the problem. Anyone else have this happen frequently?

As a proud new owner of the TOS 1.4 ROM set, I'm a little apprehensive about installing them given all this talk about weak drivers and such. (I'm also lazy.) I hit upon the idea of copying the TOS roms into a PROM programmer and making a higher density, 2-ROM chip from the 6-ROM set that I bought. It seems like it should be fairly straignt forward. I should be OK from a copyright/legal standpoint as long as I continue to hang on to my original 6 ROM set. (I believe this would be equivalent to making a backup copy.) What I need to know is what is the common device number used for the 6-ROM set, what is the common device number for the 2-ROM set, and is there a pin compatible EPROM version of the 2-ROM device number. I could try to stare at the PC board and figure it out myself, or better, try to find a schematic, but I though I'd ask here because I suspect some people may know off-hand.

stank

PS: It just occurred to me that this whole plan could backfire if the total amount of code stored in the 6-ROM set is larger than the size of the higher density ROMs, perhaps this is why nobody has discussed this idea here. If this is the case, it will become obvious to me once I know what the part numbers are. For now, I presume Atari went with the lower density parts because they were cheaper.

>machine as nice as the ST was back in 1985?? The ST beat other computers
>hands down in 1985. I wish the TT could do the same in 1990!!

Atari cannot (I reapeat CANNOT) compete with conventional computers
since these days you can find PCs with:
- Very very low prices.
- Many and cheap expanantion options.
- Much and cheap software.
- Very very powerful (memory, disk space, MIPS, screen).
- Multiprocessing of just about any kind you can think of.

So what can they do? Except of producing cheap game systems?

I believe the only future Atari has, considering non game machines
belongs in the development of multiprocessor systems.

The ATW, if it becomes comercial product before 1995.
AND it is supported.
AND has good OS.
It would be something I would consider.

Shared memory multiprocessor systems is another area that lacks
standards, is proprietary and expencive, and thus,

Available for exploitation from companies such as Atari.

Instead, what does Atari do? They prepare for next year the release of a
computer which last year would be considered a weak entry at best
(sofware, OS, expantion options, expantion price, speed, graphics, lacking).
Who cares about it? I can play games on my ST just fine.

I hope I would be surprised by Atari.

In article <46bcb82f.14a1f@force.UUCP> covertr@force.UUCP (Richard E. Covert) writes:

Gee, Richard, I thought people had been explaining to you in detail
exactly what the TT gives you.

For the present ST home user, the TT is a fast ST.

For the Unix user, the TT is a nice cheap workstation.

>And I mean the TT/Plastic as it is the most likely TT to make it
>to the USA.

Oh, I think it's pretty probable that the TT/X will make it here.

>Except for the higher color rez I don't see anything in the TT
>that would make me want to dump my investment in my current ST
>hardware.

So don't. People who NEED the TTs speed will buy it. People who NEED
Unix will buy it. People who don't need it won't...

>What would make me buy an Atari computer:
>
>1) A FAST CPU, at least a 25 Mhz 68030, with an option to go to
> 33 Mhz or even 50 Mhz as Motorola releases the faster cpus.

You don't understand what a 16 mhz 68030 means. The TT has burst-fill
mode memory above 2 megs. This means it's faster than the Mac IIcx by
as much as 50% for typical applications. Apple just released the Mac
IIci which is capable of running burst-fill ram... the TT is very
competetive compared to the Mac.

When the TT delivers it will be interesting to benchmark it against
'386-based Unix boxes. I think you'll find that it won't be that much
slower than a "33 mhz 386" because of the burst mode and other reasons.
It will not be two times slower, which you would think from the ratio
of the "megahertz". Megahertz are relatively meaningless.

>2) ability to change to a 68040 CPU without buying a whole new
> computer. That is why I can Atari computers disposable. In order
> to upgrade to a different CPU you have to "dispose" of your older
> computer.

Few if any other vendors supply this sort of capability. It costs
extra money up front.

>3) A true multi-tasking, multi-windowing OS. I mean, heck the Amiga
> has had multi-tasking since the first A1000 was released.

Unix plus X windows (or your favorite windowing system, I happen to be
partial to mgr ;-) gives you this. It's clear that GEMDOS will NOT become
a multi-tasking multi-windowing OS in the near future, not only because
it's a lot of $$ to write, but also because current GEM programs are
incompatible with multi-tasking in all sorts of little ways.

Asking for things which can't be delivered is a bit strange. Unix is
the future, Richard.

>4) An open buss so that 3rd party vendors can develop boards for the TT.

Every TT announcement so far has said the TT/X and TT/P have this.

>6) Real color graphics ala the Macintosh. 640x480 in 16 colors is a joke,
> and Atari should be ashamed for introducing a new machine with such
> limited grpahics?? The TT will be the Atari machine for the early 1990s
> and should be better then that!!

Monitors that show resolutions greater than 640x480 in color are very
expensive. Not very suitable for a small-business machine. You can
always buy some PC Klone with one if you want it.

Price high resolution monitors for the Mac. Note that they require a card.
Note that the TT/P has a card slot.

>7) A replacement for GDOS. Something that uses outline fonts. The Mac system
> beats GDOS all the way to the North Pole!! GDOS is such a memory hog that
> even 4 megs in my ST is limiting!!

A third party could do that... it would sell and probably make money.

>All in all, everything about the TT says if it had been released in Jan 1989
>instead of July 1990 it MIGHT have been an acceptable computer. But by the
>Summer of 1990, when we can reasonable expect to see the TT on USA shelves,
>it will already be outdated by the Amiga A3000, and the Mac IIcx, Mac IIci.

The Mac IIcx and Mac IIci hardly outdate the TT, especially since it seems
that they cost a lot more money (assuming the TT arrives, of course.)
Looks like Atari has a very interesting product, if they do bring out
Unix for it and ship both in a timely fashion.

And to repeat: WHY DON'T YOU JUST SHUT UP AND LET THE MARKET DECIDE IF THE
TT IS A GOOD MACHINE INSTEAD OF FLOODING COMP.SYS.ATARI.ST WITH MESSAGES
ABOUT SOMETHING YOU'VE NEVER SEEN?

>What has happened to Atari Corp??

They are making money selling computers.

Source record: 247156

I know a pretty good Modula2 compiler in Germany. It is SPC-Modula (current version V1.42). Included are a graphical shell, an editor, several utilities (a filer, a printer, an online manual, a course in Modula, ...), all of Wirth's standard modules, a post-mortem-debugger, GEM libraries, a window system and a few things more. The produced code is not as fast as that of Turbo C, but fast nonetheless. The handbook and the online manual and language course are in German, the (more important) module documentation in English. As far as I know, the English documentation is being worked on. It is a good product (I use it quite a lot). Its main drawback is a restriction of data type size to 32KBytes. All in all, it is quite a professional product. The price is about DM 400 (something like US$ 220). As far as I know, it is the official ATARI Modula in Germany.

Selling this product is:

Advanced Applications Viczena GmbH
Sperlingsweg 19
D - 7500 Karlsruhe
F.R.G.
phone: +49 721 700912
fax : +49 721 786572

I think they might be quite willing to sell their product to the US or anywhere else.

Disclaimer : I don't work for them, I just happen to know the boss personally.

2635. German on the net.

Newsgroup: comp.sys.atari.st
Date: 1989-11-10 04:01:39 UTC
From: MEGGIN@vm.epas.utoronto.ca
Message-ID: <89Nov9.231746est.57350@ugw.utcs.utoronto.ca>
Source record: 247157

I tried a little experiment on the net. recently, and I apologise to anyone who took offense. I posted a message in German, and received a variety of answers, some to my message and some commenting on my use of German.

1) US: The only people who complained about the German had US e-mail addresses. Most of them seemed to know some foreign languages, if not German, but it was the _idea_ of not using English which seemed to offend them. I guess that this grows out of the American "melting pot," where any culture is welcome but they all become the same.

2) Federal Republic of Germany: No comments on the language (I think one person politely thanked me, but said that he did not mind having to work in English.

3) United Kingdom: No one seemed to notice that the message was in German. They treated it the same way as they would have treated an English message.

4) Canada: Same as the UK. No offense at the German, and no notice of it either.

I wonder if the difference between the Atari communities in Canada and Germany (which are flourishing) and that in the US (which is stagnating) has something to do with this difference in attitudes? To be fair, I did receive one or two messages from Americans who did not mention the German at all. Also, the UK is having problems but they seem to be only at the Atari corporate end.

The ST seems to do better in a cosmopolitan environment. Many of the US addresses on the net either keep pouring out complaints that the ST is not an IBM clone, or else they fiercely attack other US ST users for daring to mention that the ST is not an IBM clone.

Most of what I see coming from non-US addresses, and, again to be fair, a lot from US addresses, is concerned with problems and issues on the ST itself -- they write and buy programs instead of always complaining about them.

2636. ST help for novice?

Newsgroup: comp.sys.atari.st
Date: 1989-11-10 04:09:24 UTC
From: adjones@mcnc.org
Message-ID: <5727@alvin.mcnc.org>
Source record: 247158

Hello,
I have a friend with an Atari ST (I think it's a 1040--plain vanilla) & I'm seeking some info for her. (She's had it wuite awhile, but is still very much a novice.) One problem is a "TOS error #35" message whenever she tries to access one particular file. She says the manual has no info about error numbers, and I had no luck at the bookstores around here. I'm sure she's using an older version of the operating system & the software she's using (a database--I don't recall the name) has probably been upgraded as well. Actually, that would be handy to know (the database name)... It had icons with names like "useone" and "makeone" and "moveone" and the database icons were named "whatever.one". If this means anything to anyone, what is the current status of this mailing list/simple DB. Anyway, what I want to know is... 1) What is TOS error #35 ?
2) Any info about this database ?
3) Is there a decent book with references on this info (error #s,etc)
4) Favorite magazines?
5) How can she update her OS without a local dealer?
Thanks very much for your help.....

>Well, perhaps you and I disagree about what a Home User is :-).

Sorry, I should have said "AVERAGE" home user. The projects you describe
seem to be something that will interest about .01% of all Atari owners,
at the most ;-)

>Something I would very much like to have on a VME card is a modem -
>not a modem for the phone line (how passe' :-), but a nice quick

Read the fine print. Doesn't the TT have a HDLC connector ;-) ?

>Anyway, I think I'm a home user. I'll probably go with the TT/X iff I
>buy another Atari at all.

Yeah, if you want to build your own hardware. But I don't, and I don't
want to cough out all that extra $$$ for slots I won't use.

2638. External 360k 5.25" floppy

Newsgroup: comp.sys.atari.st
Date: 1989-11-10 06:20:19 UTC
From: vicc@unix.cie.rpi.edu
Message-ID: <1989Nov10.062019.19498@rpi.edu>
Source record: 247160

I've got a 5.25" floppy w/cable to connect to the ST. How do I get the ST to use the drive? Is it a TOS porblem (I've got an oldish system but I don't know what version of TOS - certainly not 1.4) The drive spins when I access B: even though it asks for a disk in A: so something is going right.

Message-ID: <CMM.0.88.626682938.cmm1@cunixa.cc.columbia.edu>
Source record: 247161

Unless the TT is super cheap (which by all indications isn't true), I can't see it being very popular at all. It is already upstaged by Apple and Amiga products that have been ON THE SHELVES for months. Why should Atari release a losing product when they could save themselves the embarassment and financial loss by keeping it as a COMDEX curiosity? Although I have been very happy with my ST, it seems that the Atari R & D machine is just too slow to keep up with the times and the Atari marketing department has another agenda which does not include the ST. I have seen Portfolio adds up the yin-yang in the NY Times Business sections, but the ST line languishes in R & D limbo. It is a crying shame that the ST line is supported in such a manner, as I believe the machine COULD have been a big seller. sigh....

|
| I've got many disks with accessories, AUTO programs, etc. Sometimes
| when I boot up with such a floppy (I'd guess about 10% of the time) I
| get the computer loading a few of the accessories, but then doing a
| cold or warm boot in the middle. It's like someone hitting the reset
| switch during bootup before the GEM Desktop appears.
| [...]
| got 1 Meg so memory might no be the problem. Anyone else have this
| happen frequently?

This sometimes happens to me, with about the same frequency. The boot
procedure seems to go all right, and then suddenly a reset occurs.
The machine boots again, and everything is fine.

I boot from a hard disk (megafile 30), and I also stick to the rules.

First, I thought this might be caused by random bits in RAM, which make
TOS think something terrible has happened.
However, yesterday I noticed that the reboot occurred after the set
time/date program was run from the auto folder, and that it ocuured
when I set a wrong time/date, i.e. I just kept the time/date of the
previous boot. Maybe the program notices that it has been active at
some later time/date (some set time/date programs save the time/date
information) and doesn't want this.
It might also be the case that an error occurs while trying to set the
internal ST clock. I do not have an add-on clock, b.t.w.

This was what I could think of, but it doesn't sound too probable to me.
Maybe someone else knows the reason for these spurious reboots?

> forward. I should be OK from a copyright/legal standpoint as long as

I think this is impossible, for the following reason: The ROMs in a
mega-ST have a standard pinout. All pins are used on these ROMs.
An EPROM needs an extra pin (Vpp) in order to program it, and with
this standard pinout, there is just no spare pin left for this function.
So I am afraid you will not be able to find EPROMs which can be used as
an equivalent for the 2-ROM set.

l> Of course the Amiga system can run another program, such as a
l> spreadsheet, while in WordPerfect, but this is not the same as
l> the 'handy' collection of accessories located in one convenient
l> area of the menu bar.

On the Amiga, the Workbench (our equivalent of the Mac Finder or the GEM Desktop) is always available. So it's easy to push your WordPerfect (or whatever) window aside and click on a new icon to start another concurrent program. There are also "hot-key" programs avaialble that bring up a shell at a moment's notice, whereupon you can run any other program on the system.

If you really want a 'handy' collection of frequently-used programs on the menu bar, there are also PD programs for the Amiga that add such a menu to the Workbench menu bar.

I'm not trying to fan flames; I'm just making sure that information is accurately presented.

I don't live in your area, but I agree with you. Customers should not have to pay for the store's extended phone bills. There's this thing in business called overhead or the cost of doing business. You don't raise the price of one item to offset bills incurred from problems with a supplier. You chalk it up to overhead. If the product is essential, you eat the cost as long as it is within the bounds of a previously budgeted 'overhead' figure. If it doesn't then don't carry the product until you can get it without the extra phone bills.
This is a gouge.

2644. Wanted: Converter for Degas/Neochrome pictures!

Newsgroup: comp.sys.atari.st
Date: 1989-11-10 14:56:38 UTC
From: phil@mva.cs.liv.ac.uk
Message-ID: <2898@mva.cs.liv.ac.uk>
Source record: 247166

HELP!!!!!
Does anyone have any programs that can convert Neochrome or Degas files into one of the graphics interchange standards? Failing that does anyone have any info on the format of Neochrome or Degas files so that we can write our own?
I'm posting this message for a student who is doing a project using images scanned from a camera - he wants to send the images to a mainframe for various purposes, and of course they are only saveable in Neochrome and Degas formats - and we don't know of any mainframe conversion routines for these 2.
If anyone does know of any such thing - please mail to me at the address following - I don't normally read this group.

Thanks for your help...

> be able to use the Blitter, which, of course, was due out RSN. Don't
> know if I should blame my dealer or Atari, but the example stands.

Anthony Lapadula expressed my sentiments exactly!!
My complaint (call it whining or bitching if it pleases you)
has centered around Atari's lack new products and of poor
support for existing products. I still enjoy using my Mega ST4
and wouldn't want a Macintosh (well maybe a Mac IIci :-)).

and Atari has a long history of lying to their customers dating back
to the promised Blitter chips for the 520/1040STs. Atari's attitude has
been "We will promise you anything to get you to buy our product, but
don't hold us to our promise". Also, Atari has said if you want the Blitter
buy a Mega ST. Now, the Mega STers have to downgrade to the 1040STE to get
the new stereo sound and hardware scrolling it it. What kind of treatment is
this?? I, for one, bought my Mega ST because of its superior keyboard. I don't
want to go back to a 1040STE with its keyboard just to get some HW improvments.

So, what else can a long time Atari SUPPORTER do?? Obviously the Tramiels
don't listen to their DEALERS or their CUSTMOERS.

My local Atari dealer is going to COMDEX next weeek. I can't wait to see what
he reports back about Atari's presence at COMDEX.

To Richard E. Covert and others of your philosophy:

Expansion cards in computers were quite popular back in the early 80s
for computers such as the IBM and the APPLE. Expansion was a desirable thing
because a computer without any cards in it was USELESS!

you needed a focking expansion slot in your computer to run your bloddy
disk drive. Serial port? Buy a card! Parallel port? What kind? There ain't
no standard (with the Apple's anyway).

one card isn't really that bad anymore - we already have enough ports
built-in, and that was the primary purpose of one of these interface
cards anyway - for simple i/o.

Any analog-digital converter SHOULD be designed to plug into a DMA, SCSI
or some other fast port. This way, it won't be computer specific.

In general, computer specific hardware addons will be a thing of the past.
I mean, shit - if we have a DMA port which can transfer data at 10
megabits per second on our old clunking 1040sts, guess how obsolete a
card slot which works with IBMs will be (I wish I had some numbers, but
I bet that those card slots in the IBMs aren't much faster if they are at
all).

The only things we would need slots for nowadays is for accelerators,
graphics enhanceors, and perhaps emulators. But maybe even these won't
need to take up a VME slot if the computer is designed well enough.
Taking up a VME slot for a stupid graphics enhancer is like using a steam

roller to kill a spider...

I found another MWC manual error. If you lookup "form_do" you see that
MWC says to pass a ZERO if the dialog box doesn't have any editable fields.
Actually that MUST Be a negative one (-1) according to the Bantam book
of GEM/AES programming.

Has anyone else found any errors in the MWC Version 3.0 manual??

Rich Covert

P.S. I found a VERY serious bug in Michtron's WERCS Resource Editor. DO
NOT use the UNDESCORE CHARACTER (_) in object names. I am writing a GEM
interface to a program and I kept blasting my HRD file while using WERCS.
HRD is where WERCS stores its internal info about your RSC file. Anyway,
once I stopped using the underscore char in my names WERCS hasn't bombed
once. This hapens on a 520ST with TOS 1.0. My Mega ST with TOS 1.4 is in
the shop so I can't determine if the bug is the infamous TOS 1.0 bug, or
if it is in WERCS. But, just be warned about the underscore char and WERCS.
Other then that, I really like WERCS. It has a test mode where you can see
what you buttons return. It has a utility to convert DEGAS pics into icons.
a really nice package.

But, of course it is nice, it came from Europe!!!

Richard, I humbly suggest that what you seem to want, and what I myself wouldn't mind having, is an ST emulator for the Amiga. Think about it. You want plug-in CPU upgrades (Amiga can do). You want multitasking (Amiga can do). You want slots & a more standard bus (A2000 can do; didn't C= design the A2000 with some slots that accept PC cards?). You want better graphics (well, C= continues to improve their graphics chips, and with an A2000 you can buy a PC Targa board if you need something better). Outline screen fonts? Well, I don't know of any box in the general ST/Amiga/Mac price-range that does that (though I'm sure I'll be "gently corrected" if I'm wrong ;-).

I don't own an Amiga, so please abort any "Oh gawd, another Amigoid who thinks his machine is better" followups. I'm not trying to start or perpetuate another stupid flame war. I own a 520ST, and have since '85. It does useful things, but I'd like something better and for various reasons I'm reluctant to consider buying another Atari box (and can't afford a NeXT, Sun, Apollo, MacIIci or any similar machine with the features I want).

As far as I can tell from your many previous postings, the only real reason you have (or that any of us have, probably) for wanting to stick with an Atari-brand machine is the (possibly substantial) investment you've made in software.

Perhaps we should undertake to write one? I have access to an A2000 and (obviously) an ST. What do you say? Anyone else interested? Is it easy? Probably far from it. Perhaps impossible to do (legally, anyway -- I'm not contemplating making a disk-copy of my TOS ROMs ;-P). But at least it would give us something constructive to do with our dissatisfaction, and everyone else could go back to sleep. ;-)

Yes, I am currently running such a package on my ST which is part of
an amateur radio network. The package supports Telnet, FTP, SMTP and
Finger. It has drivers for both the MIDI port as well as the AUX port.
The MIDI port can be run at 30+ Kbaud. In addition I have information
for hardware modifications which allow multiple amateur radio interfaces.
The most recent version of this package, originally written by
Phil Karn, KA9Q (amateur callsign) and modified by Rob PE1CHL has
numerous other features including an elm-like mailer written by
Bdale Garbee, N3EUA.
I believe that both object and source (Mark Williams C ready) is
available from more than one site by anonymous FTP. It is available
for amateur radio and , I believe, other non-commercial use.
If you are interested, e-mail me and I will dig up more access
information.

> Yep. The SLM804 does not have local memory. It allocates parts of the ST's
>memory to store images. This takes about 1Meg, as I know.
> Where do you think are the bucks you save not buying a LaserJet ? :-)

Noyes - There's an accessory which emulates an EPSON FX-80 fairly good
that will work with less than 1 MByte of RAM.

It will allocate a certain amount of memory the first time it is called
(you can let it do this during installation of it as accessory with a special
file) and then work as an EPSON FX-80 printer - It works pretty well.

How much memory does it need? Well, Currently I'm running it with
about 700k which is - admittedly - much provided that you have only 1 Meg of
memory available. The manual of this software - it's called LASERBRAIN - states
that for pure text printing 40 K should do - if you want to use the supplied
fonts for printing you need more memory. I ended up using 700k.

I got LASERBRAIN for free from Atari, West Germany (I send them a 3.5"
disk and got another one back with the emulator, fonts, and manual on it -
also included were a configuration file for 1st Word Plus and Adimens).

Source record: 247175

Another gold star for the Spectre: I bought a Spectre 128 in August (along with a [yech] Translator One that actually works sometimes), back before the days of the GCR. One of my usual IBM programming contracts expanded into a Mac port, and rather than buy another computer that I didn't really want in the first place, I got the Spectre and Think C. Three weeks later my first program (which, incidentally is a commercial program) was in final form, and I hadn't managed to crash the system even once. I was afraid that trying to develop software with a Spectre was going to be a fiasco, but I must say now I am more than pleased with the outcome of this experiment.

Has anyone out there received there November issue of STart. I have and there is an amazing program on it called RezRender. You must have CAD-3D 2.0 or Cyber

Sculpt to run it, which I have both, but what it does it amazing. It applys various shading techniques and/or ray-tracing shadowing to your .3d2 files. My question is this, for anyone who has used this program, or the authors if you are out there: several of my files contain large numbers of points and when RezRender is rendering the Superviews of these files, it bombs out and sends me to the desktop. Has anyone else had this problem? Is there something that can be done to fix it? Does anyone else out there use Cad 3d?

advTHANKSance,
Chris

Hello,
Does anyone out there know where I can get a new cable that
goes between my 520ST keyboard and the actaul machine itself. You
know, the one with able 30 wires and partially wrapped around a
thing that looks like a magnet. Mine seems to be having problems
at the moment; eight keys stop working every so often, and this is
getting overly annoying.
Does Atari fix this kind of thing? Or, does anyone know of a
good dealer in the southeast or Boulder CO area?
--
Thanks, Scott P. Leslie (UNCSPL@UNC) Jax

2656. Atari ABC-286/30

Newsgroup: comp.sys.atari.st

Here's the ABC specs for the netter who asked for info

Intel 80286-8 @ 8 MHz
640K standard, expandable to 4 Meg; 96k ROM
68 watt p.s. <--that's what my specs say; looks low to me!
1-serial, 1-parallel
DOS 3.3, Windows/286 Windows Write/Paint/CardFile
AMI BIOS
30 meg RLL HD (65ms)
1.44 meg-3.5" floppy
MDA/MGC/CGA/EGA graphics card

Canadian price approx. $2000, (about $1650 U.S.)

I think this includes a mouse.

First of all, you get a 68000 microprocessor for half (or less) the price of a Mac. Ever try programming in assembly on a 80x86? Gaak.

You also get a computer which can be expanded to run Macintosh software, PC software, Atari 800 software (nice for those of us who have been with Atari for a while), Apple IIe software.

You also get a computer with lots of PD software (unix shells, editors, compilers, games)

You get a computer which runs neither MS-DOS nor Finder (Both of which I despise) unless you really want it to, and which can run unix-like shells (Gulam, MT-C shell).

You get a computer with built-in midi capabilities and lots of midi software available.

You get a computer for which you don't have to buy a bus card every time you get a new piece of hardware.

You also get a computer on which you can play games if you want to. I am a programmer, so I don't play games much (I sometimes write them...) but it's nice to be able to play an occasional game of Tetris (which happens to be PD on the ST...)

Sure, I have one running at home.

A version of Phil Karn's NET has been ported to the ST. It's restricted freeware, available for noncommercial unlimited free use, for educational and personal applications. Business use is a no-no. The principal use is ham radio; it has a lot of ham special support (i.e., AX.25 and NET/ROM subnets). It has SLIP too.

I don't have an FTP repository here but it's on a couple of the ones used by the ham tcp-ers, usually called NETST or some such. The last version I have is (if I recall) based on version 890421.1.

>as much as 50% for typical applications. Apple just released the Mac
>IIci which is capable of running burst-fill ram... the TT is very
>competetive compared to the Mac.

Let us see some facts. From BYTE magazines:

IIcx IIci ALR/25 SIA/32

Matrix 16.2 10.5 2.62 2.10
Sieve 31.4 19.8 14.06 11.02
Sort 29.7 19.4 10.52 8.26

Mac IIcx, 16Mhz, 120ns Dram, No cach, No Burst fill mode.
Mac IIci, 25Mhz, 80ns Dram, No cash, Burst fill mode.

ALR 386/25, 25Mhz, 80ns Dram, Cash, interleaved memory.
SIA 386/32, 32Mhz, 80ns Dram, Cash, interleaved memory.

>This means it's faster than the Mac IIcx by
>as much as 50% for typical applications.

Since the IIci is only 35% faster than the IIcx, I could not expect
the TT to be more than 20% faster that the IIcx.

In performance maybe. (Because the Macs are slow (no cash)) (compare with 386)

In support?
Compare Atari support with Apple support?

Do you mean software? Like the OS updates, the multi-finder vs TOS 1.4?
Do you mean hardware? The Mac IIci vs the Mega 4?

So, Think's C works. I have Think's Pascal which in fact doesn't work.
It seems to do some illegal things with the mouse, because when you boot
it, the mouse will not move. You can quit by Command-Q. I've been hesitant to get Think C
because of the situation with their Pascal. Thanks for letting us know that it works.

There was recently a question about Music notation packages for the ST
there was recently a very good review of a product in the British mag ST-World
(October I think). This was called Music DTP and was produced by a firm called
Take Control. This was a DTP prog purely for music, I have seen output on
the Atari Laser, NEC P6/7/2200 and Epson, I think it does laserjet (as it is
GDOS based) and I believe Postscript is on the way but I am not sure. I do not
have the adress of this firm but some other British user on the net may have.

As far as I can tell the prog does not support Midi (at the moment) but it
offers typographical control far beyond the midi based systems. I saw it at
the last Atari Show (here in the UK) and was very impressed. I think it
costs about 300 pounds.

Hope this is of help.

p.s. sorry about using two recentlys together in the firstt sentance.

>is... 1) What is TOS error #35 ?
Strictly speaking it means there are too many files open (or no more files can be opened). In reality it usualy means the particular file you are trying to run is corrupted. Sometimes because it was downloaded from another system and the download was not done correctly.

> 2) Any info about this database ?
Nope.

> 3) Is there a decent book with references on this info (error #s,etc)
See below...

> 4) Favorite magazines?
START is not bad if you want to read a lot of reviews. CURRENT notes (actualy a THICK club newsletter which reads more like a good magazine) is pretty good and has a variety of topics.

> 5) How can she update her OS without a local dealer?
Can't answer that one.

Ever wondered what those TOS error messages and 'bombs' on your monitor signified? Below is a letter, originally written by Darryl May, that John Townsend of Atari posted on GEnie in January to provide some answers. This letter also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170).

Dear ATARI customer,

The following is an official list of the errors that can appear while you are operating your ST computer. This first list gives you the GEM error messages:

To Richard E. Covert and others of your philosophy:

Expansion cards in computers were quite popular back in the early 80s
for computers such as the IBM and the APPLE. Expansion was a desirable thing
because a computer without any cards in it was USELESS!

You needed a expansion slot in your computer to run your bloddy
disk drive. Serial port? Buy a card! Parallel port? What kind? There ain't
no standard (with the Apple's anyway).

one card isn't really that bad anymore - we already have enough ports
built-in, and that was the primary purpose of one of these interface
cards anyway - for simple i/o.

Any analog-digital converter SHOULD be designed to plug into a DMA, SCSI
or some other fast port. This way, it won't be computer specific.

In general, computer specific hardware addons will be a thing of the past.
I mean, shit - if we have a DMA port which can transfer data at 10
megabits per second on our old clunking 1040sts, guess how obsolete a
card slot which works with IBMs will be (I wish I had some numbers, but
I bet that those card slots in the IBMs aren't much faster if they are at
all) when the TT comes out?

The only things we would need slots for nowadays is for accelerators,
graphics enhanceors, and perhaps emulators. But maybe even these won't
need to take up a VME slot if the computer is designed well enough.
Taking up a VME slot for a stupid graphics enhancer is like using a steam

roller to kill a spider...

Just a point of information. Skip if you don't care.

In article <2245@hudson.acc.virginia.edu> gl8f@astsun8.astro.Virginia.EDU (Greg Lindahl) writes:
>Few if any other vendors supply this sort of capability. [To upgrade the
>CPU in your computer]
Several companies offer this solution, actually. Every maker of a backplane-based system. Commodore-Amiga. Even (gasp!) IBM, if you're talking about going from a 386 to a 486. Zenith had some very nice backplane units with processor boards, some years ago; they stopped making them for several reasons, most of which escape me right now.
A company which shall remain nameless has already announced that they'll have a 68040 board for current systems when the 68040 becomes available in large quantities.
I think offering a processor upgrade path would make the Atari line more interesting to the buyer. Official memory upgrade paths would do the same. I've seen more than one person turned off by "you mean, I have to go third party to put in more RAM? I think I'll look at this other machine..."
Just two cents worth

Yes. The same with the 2500. Don't know about the 3000, since it
isn't ready to market yet.,
> Perhaps we should undertake to write [an Atari ST emulator]?
AMax, a Macintosh emulator for the Amiga, requires a hardware box
in which you insert legally-purchased Macintosh ROMs. You may wish to
consider a similar approach. (Their box also included special circutry
to allow you to use a Mac drive, something that would be unnecessary
for a ST emulator, since Atari didn't screw up THEIR floppy system...) :-)

Although the ST DEsktop has its mouse-based advantages, I'm really starting
to miss the MSDOS/UNIX type abilities to just type CD somewhere or
run a program anywhere by typing its name or path, or the advantages
of simple batch files. I'm getting real tired of clicking my way through the
7 partitions of my 85 meg drive to get to the directory I want just to run
a program.
Anyone know of a command driven TOS interpreter ala MSDOS that's
public domain. If not, I'm about to write one. Although utilities like
Universal Item Selector are good, I haven't seen one as useful as QDOS
is for the IBM.

>terminator archive via mail from the uk?

When terminator is doing mail service, yes, you can reach it from the uk.
However, the mail server for the atari archive has been turned off due to
the abusive practices of some users. We've been working on a new server,
but due to time constraints it may not be done for a long time.
(christmas vacation is an optimistic guess)

The lack of new stuff on terminator is also due to a lack of time on my part.
My apologies to the Atari community.

>SIA 386/32, 32Mhz, 80ns Dram, Cash, interleaved memory.

You left off a few details. OS for the 80x86 boxes? What fraction, if
any, of the IIci memory is running with burst fill mode? And was the
on-chip cache on the 68030 enabled?

From the speedup between the x and i, I would think that the IIci wasn't
using burst fill at all.

Finally, benchmarking is a black art. I prefer benchmarks which are
similar to the programs which I run, which are all large-memory-model
programs that are big. The Byte benchmarks aren't in this category.

The FACTS will arrive when you can run your *application* on a TT and
on other machines and compare the results.

Correct me if I'm wrong, but as I understand it, VME is a multimaster bus
which means that you can plug another processor board in there and let
it control the system. Perhaps this is one of the reasons Atari chose to
use an expensive bus standard.

2673. MWC errors (was Re: GEM help needed)

Newsgroup: comp.sys.atari.st
Date: 1989-11-10 21:24:55 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <10121@stag.math.lsa.umich.edu>
Source record: 247195

Something else I noticed with MWC 3.0.x - does your library (libc.a) have
the difftime() routine? Mine didn't. When I ordered the C source for the
library, I noticed that the source file is present but never mentioned anywhere
in the makefile. Thus, it never gets compiled, and no such routine gets into
your C library. Ooops. So there's an example of a routine that's documented
in the manual, but not present in the library. As opposed to all the routines
that are in the library, but never documented...

>happen frequently?
I used to use TIMESTER in /AUTO to set the time and occasionaly had it bomb on exit causing a reboot. After a while I tried writting my own time/date setting program which worked a lot like timester and ran into the same problem. I never figured out if it was setting the date/time, changing the timestamp on the .PRG file, or some other thing that caused the bombs.

Of course it could be a combination of setting time/date and using IDLE12.PRG (I use it my my /AUTO also!).

Atari already has announced the technical specifications for the first TT, so you can't help it, can you? By the way, don't you know that Atari has said that the ATW's nice graphics card will probably be introduced for the TT (this has been posted here)?

You REALLY DON'T HAVE TO SUPPORT ATARI if you don't like them! You can by all means change the company. I can see no reason why Atari wouldn't try to do all they can. If they can't do all you want them to do, it's not their fault. Find a company that can fulfil your needs.

> Is this right?

Yes. The only part which has the version number 3.01 is the driver,
called AHDI.PRG when it's in the AUTO folder of the floppy, called
SHDRIVER.RAW in the HINSTALL directory, and called SHDRIVER.SYS when
it's instlled on your hard disk. For everything else, 3.00 is right
and fine.

I posted a message to the net about a British program called Music DTP, this was a music typesetting prog for the ST. At the time of posting I could not find the address, however I have found it so here it is.

Take Control
Jonic House
Speedwell Road
Hay Mills
Birmingham
B25 8EU
ENGLAND

Reports indicate that the PostScript driver is near completion and if it looks as good as the SLM804 output that I have seen then it will be impressive. A review can be found in Octobers ST-World. If anyone Stateside cannot get a copy of the review then post any queries to me and I will try and relate to you the info it contains.

Yes it does work on US machines. It's a VERY neat program. You can hours
of fun with it by turning on some of your favorite music and just playing
with the effects in a dark room.

I would recommend it! It's great.

>but I don't know what version of TOS - certainly not 1.4) The drive
>spins when I access B: even though it asks for a disk in A: so
>something is going right.
>
There are a few things you have to do to get it to work:

1) Remove the resistor terminator pack
2) Track down a 150 Ohm resistor that's tied to the +5V line. This
resistor brings the voltage down to 2.5V when the drive is called.
However, the Atari needs it to be 0V. Replace it with a 1K Ohm
resistor.
3) Get a copy of the PCF554.PRG program. You have to slow down
the access to drive B (the 5.25 inch drive) to 6ms. It cannot
reliably access the drive at 3ms.

You'll also have to use a program like DC Format 3.02 to format the
disks. You cannot format them using the desktop. Also, you will have
to mess with the different jumper blocks on the board to find the
correct configuration.

>First of all, you get a 68000 microprocessor for half (or less) the price of
>a Mac. Ever try programming in assembly on a 80x86? Gaak.

I have never thought of the posibility of buing a Mac. Proprietary system yach!
I would use assembler only if my life depended on it.
What is wrong with Turbo Pascal?
Link with 100 bytes of assembler if it is really necessary.

Once I used 8086 asembler. I will never forget it...
But with the advanced compiler and the comming of the 80386 should not be
any problems.
(Unless you have to write a lot of assembly and keep it MSDOS
compatible too, maybe)
And 386 systems are dirt cheap too.

>You get a computer for which you don't have to buy a bus card every time you
>get a new piece of hardware.

I cannot help but think that the alternative would unfortunately be
buying a whole new computer instead.
(What is worse is that often there is not even a new computer to upgrade)

I will go back to my first point.
I don't think there is much future for the Atari in the establised marked
of PCs or systems with excellent (often specialised) support.

It would be great if they attempted to establish a multiprosessing standard.
If it is cheap and fast and has good graphics, it is certain to succeed.

Source record: 247208

Dearest Netters,

I am looking into trying to learn a new computer language,
but I really don't know which one to try out. The only things that
I must have is a language that is in the Public Domain or it is
Shareware (I'm a poor college student!), the language must support
graphics and sound without too much hassle, and it _MUST_ be able
to run on a 520STfm with 512K and a 360K SS/DD disk drive. Well
that narrows it down, doesn't it. I don't really want to learn
68000 assembly language and I only know BASIC and a little bit of
Logo. (Pretty Limited, Huh?).
You guys and gals are my last hope! Save me from expensive
languages and ST BASIC!!!!!ARRRRGH!
By the way, if you have any suggestions, please tell me where
I can get it (mail-order, ftp, e-mail, etc.). Thanks.

Eric Hobbs

> Anyone know of a command driven TOS interpreter ala MSDOS that's
>public domain. If not, I'm about to write one.

There are probably a dozen or more free or shareware command shells for
the ST. The most well-known is gulam, which uses a Unix-like command set
and includes a built-in version of MicroEMACS and a communications
terminal. I currently use John Stanley's jShell (it's small and has a nice
uEMACS-style command-line editing facility).

Others I have used include David Parsons' tsh (Teeny Shell), a Korn
Shell-like interpreter with a very powerful scripting facility, and
PCommand, which is very much like the MS-DOS COMMAND.COM interpreter.

There are several commercial alternatives, too, including the msh program
that comes with Mark Williams' C compiler, and Dave Beckemeyer's Micro C
Shell and Multitasking C Shell (the latter for use with Micro RTX).

With many of these interpreters, you can create a batch file (shell
script), install the interpreter as a .TTP application (using the GEM
Desktop's "Install Application" menu), and run the batch file from the
desktop simply by clicking on it.

You don't have to use a command-line environment to avoid having to click
your way through 85mb of folders, though. Neodesk, a replacement for the
built-in GEM Desktop, lets you drag program icons out on the desktop where
you can reach them without having to dig into folders. And, incidentally,
you can design your own icons for the programs. Another program, Hotwire,
lets you define alt-key combinations to launch programs.

There are some MS-DOS like interpreters for ST. I have not used them so
I don't know are they worth having or not, but I do know that there is
gulam -shell that is very much like Bourne shell in Unix. I have used it
about a year now and I think it is just *GREAT*

Date: 1989-11-11 19:23:45 UTC
From: pi@csd4.csd.uwm.edu
Message-ID: <893@uwm.edu>
Source record: 247216

I am wondering if anyone has used any of the Unix shells for the St?
And if someone could compare and/or contrast the differences between
the better ones.
Also, does anyone know of a good Pascal compiler that works under a
smilar shell.

Thanks, Pete I.

BTW : I am sick (and tired) of TT bashing. You can complain of its faults
now, but Atari will not change it. There is nothing you can do.
As far as we know, Atari people do not even have the exact stats
on their own machine, therefore, how are we able to know what
these stats are? Complain when it is released, not now.

PS : If you are looking for an ARGUEMENT (Monty Python type) I think
there are people on Rec.humor.funny that are looking for one. Maybe
they have 'Information' on the TT!

2695. Federated sale

Newsgroup: comp.sys.atari.st
Date: 1989-11-11 19:38:26 UTC
From: steve@thelake.UUCP
Message-ID: <1011891338261764@thelake.UUCP>
Source record: 247217
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

According to the Associated Press, Atari Corp. has agreed to sell 26 of its Federated Group consumer electronics stores to Silo Inc., a U.S. electronics retailer. The agreement covers 21 Federated stores in Los Angeles and Orange counties and five in San Diego. The price was not announced. The article said Atari is still trying to sell 14 remaining stores in Texas, Kansas and Arizona. Federated had 91 stores when Atari bought the group.

2697. Atari ST Multitasking/Multiuser OSs

Newsgroup: comp.sys.atari.st
Date: 1989-11-11 21:13:32 UTC
From: gng@spocom.UUCP
Message-ID: <13@spocom.UUCP>
Source record: 247219

(I'll admit, this may be long for a summary, yet there's just so much basic information for each system...that...well...you know...arrgh :-)

This summary of Atari ST multitasking multiuser operating systems includes quotes and other informative aspects from the users themselves.
(I may have edited some quotes and such for space purposes.)

Thanks to: attctc.Dallas.TX.US!jdoss@wuarchive.uucp (Joe Doss)
(for Minix/ST information)

jclark@ucsd.edu (John Clark)
avy@gkcl.ists.ca (Avygdor Moise)
(both for OS-9/68000 information)

and to myself for MT C-Shell information :-)

Note: Hmm...only three people responded to my posting - did I post it at a bad time, or is it because that there really aren't many ST users out there that use multi-OSs? C'mon people, enough of this 'bashing' on the ST and whatnot - wake up and smell the coffee! The multi-OSs are available out there for the ST - It used to take a bit of searching before you could find one, but look now - they're here, and they work - and if you still feel like bashing the ST without any regard as to the 'now' availability of these fine ST-based multi-OSs, then you don't know the great things that you're missing out on...
(Email to me if you happen to use a multi-OS.)

MINIX/ST version 1.1 (herein referred to as 'Minix')

(Joe Doss has been using Minix for eleven months.)

Minix is both multiuser and multitasking. A minimal setup for Minix would be a 520ST with a SSDD drive. A more usual one would be a 1040ST/20meg hd. And for those power-hungry users, a Mega 4 with a 100meg should suffice quite nicely.

Almost anything written for Version 7 Unix runs without changes. Programs that take advantage of newer features in System V or BSD are sometimes difficult to port. It is also slow, compared to other OS's and it doesn't come with all the standard Unix utilities.

Minix has good Unix compatibility (Joe gave it a 9/10 rating for that), and the source code to the entire OS comes with it, so changes and improvements are easy. Minix is well supported on Usenet in the comp.os.minix group, and improvements and new utilities are constantly posted there.

Minix is written by Andrew Tanenbaum (ast@cs.vu.nl)
Info is available from: Prentice-Hall Inc., Englewood Cliffs, NJ 07632

Suggested price is $79.95 US

MT C-Shell version 1.20 (herein referred to as 'MTcsh')

(George Ng has used MT C-Shell for three years.)

MTcsh is a multitasking/multiuser add-on to TOS. It requires a minimal configuration of a 1040ST with a DSDD drive. With TOS/GEM programs taking up memory space while multitasking, it would be more wise to get a Mega 4 with 60megs+, and probably other addons like speedup programs and hardware accelerators (could apply to other OSs also).

MTcsh strives for compatibility with both TOS and with Unix. With the appropriate support software, most Unix applications can be ported over to MTcsh (my personal Unix compatibility rating - 7.5-8/10).

By keeping compatibility with TOS/GEM programs, much of the software already written is still useful under this multi-OS environment. There is some disadvantage to this because some software isn't written in mind for MTcsh, so it might sooner or later crash under MTcsh. Also, since MTcsh is more TOS than Unix, the deficiencies of TOS are also kept - twelve character filenames and "\" filename separator for changing directories is still used, rather than the longer Unix filenames and "/".
(Things to keep in mind when porting Unix stuff over to the MTcsh.)

Yet MTcsh is still quite reliable, has a lot of software designed especially for it (UUCP, Visual Shell interface, etc) so it is able to approach the functionality of Unix on a much smaller scale. Support from the company is excellent.

MTcsh is $129.95 US and is available from:
Beckemeyer Development Tools, 478 Santa Clara Ave., Oakland, CA 94610
415-452-1129 (voice), 415-452-4792 (bbs),
david@bdt.UUCP (David Beckemeyer)

OS-9/68000 version 2.3 (herein referred to as 'OS-9')

(John Clark has used OS-9 for two years, while Avygdor Moise has used it for seven years, and with three years on the Atari ST version.)

OS-9 is both multitasking and multiuser. It can run on a 520ST with a SSDD drive, but works best with a 20meg to 30meg hd, and with maybe 2 megs of RAM.

For Unix compatibility, vanilla flavored C code is usually ok to port to OS-9. There is a PD/Shareware "unix" support library which has more of the typical 'Unix SYSV/BSD" functions. But any Unix code which has 'fork' or 'vfork' is dead. But as John explains, it "can be revived by major shock treatment". :-) Avygdor mentions that on the C level, it's "99.9 compatible" with Unix, while on the OS level, it's "1:1 correspondence, but not directly comparable".

There is no, virtual memory management (for 68020/PMMU, 68030). As mentioned before, you would probably need to supplement the Microware Lib's with PD stuff in order to port Unix code more "easily". The command shell stinks, but

there's hope, and at the moment, there's not enough user utilities.

OS-9 is cheaper than Unix, and its drivers/low level OS interface are simpler. Drivers can be dynamically loaded and unloaded (need to be loaded before and during use). OS-9 is also used for CD-I, Computer Disk Interactive. This is a CD-ROM with programs to access the data. The idea is a box with all the data, programs, and processor available cheap enough to be purchased by the large consumer electronic buying public.

Overall, OS-9 has the Unix feeling, it has rommable code, it's different, it operates in real time, and of course its small, fast, and simple.
OS-9 is a good solid OS, and it never crashes the system.
A very worthwhile, solid development tool.

OS-9 is available from:
Microware, 1900 N.W. 114th St. Des Moines Iowa, 50332, (515)-224-1929
(West Cost Sales Office (408)-980-0201)

Prices:
$150 US for "OS-9 Personal" (only has BASIC)
$400-$600 US for "OS-9 Professional" (has C and assemblers, linkers, etc).

>
I didn't see any smilies on that. Commodore has lately (last 1.5 years) been doing a wonderful job of improving their customer and developer support. I would not accuse CBM of lying or cheating; for that, you should see Apple, Inc. These days it seems Commodore is running a fairly clean and smooth operation. It just keeps getting better.

I wouldn't label the A3000, or even Amiga UNIX (AMIX), as vaporware. Amiga UNIX is, in fact, in functioning existence as we speak, and was demoed recently at some UNIX convention. The 3000 is simply the next step in the evolution of the machines, and there WILL be more, rest assured.

Naturally, nobody in this newsgroup really cares what happens at Commodore. This is an Atari group. I'm an Amiga person (see .sig), and I just dropped in to see what you people were doing with your machines, so that I might make more intelligent conversation... This was the first article I saw. It's sad, really, since this kind of brand-prejudice is totally non-productive and has helped us all to come to live in an IBM-dominated world. I sure hope the rest of this group is better or I might as well just unsubscribe...

Since the IIci uses a 25MHz 68030, I can't see how this will come close to
IIci speeds.

Will they also port a Unix to make use of the 68030's built-in MMU? That
would be a Win.

Until the A3000 comes out, I will call it vaporware. It may exist in some forms somewhere, but unless _I_ can get it, it's vaporware.

>I wouldn't label the A3000, or even Amiga UNIX (AMIX), as vaporware. Amiga
>UNIX is, in fact, in functioning existence as we speak, and was demoed
>recently at some UNIX convention.

I've seen many things demoed at computer shows. I saw a nameless PC supposedly running some software, when in actuallity there was a VAX behind curtain #1 running the demo. Appearance at a ComShow is hardly a guarantee that the product exists. I made the mistake of pre-ordering a software package at a show (yes, I saw it run) and found out later it was probably 6-12 months 'til shipping.

Not true at all--I care a lot since I may very well buy an Amiga. I'll still keep my ST, it's a cool machine. But being able to put in a BridgeBoard, 68030 @ 25-33MHz, MultiPort serial board, easy GenLock stuff, etc. has pushed me to buy a Commodore (something I swore I would never do when I saw the Vic-20)

And I don't think loyalty to Atari pushed us to domination by Big Blue. In fact, just the opposite--our tolerance of Atari has _kept_ Big Blue from totally dominated with their antiquated machinry.

I'll probably end up buying an Amiga 2500 w/ accelerator, bridgeboard, a 25NHz 386 for Unix (unless Commodore's is good), and keep a decked-out ST. The best of all worlds. An ATW is still a possibility, but I haven't heard back from whoever it was I wrote to in England yet.

2707. Calamus Outline Art

Newsgroup: comp.sys.atari.st
Date: 1989-11-12 13:24:06 UTC
From: MEGGIN@vm.epas.utoronto.ca
Message-ID: <89Nov12.083159est.57346@ugw.utcs.utoronto.ca>
Source record: 247229

I don't think we're too far away from a North American release of Calamus Outline Art, so I thought (with ISD's permission) I'd post an important warning about it.

All of the compugraphic fonts are drawn as continuous outlines. For example, there are _only_ two paths in the letter O, one in the letter I, etc. Outline will work well only with these fonts -- otherwise, when it shows a font outlined, it will show all of the criss-crossing lines which you see in the font editor.

If you are designing PD fonts, beware! Also, please put the hyphen (vs. dash), close quote, etc. in the same place as they are in the compugraphic fonts. Do _not_ use the free fonts supplied with Calamus as a guide.

I have been beta-testing (and just using) Outline Art for a few months now, and it is an astounding program. I do not work for ISD, we just get along well.

David Megginson, Centre for Medieval Studies, Toronto

==========================================================================

Thank you for attending this special RTC. Our guest is Dave Small,
of Gadgets by Small, makers of the Specter 128 and Spectre GCR Mac
emulators. During the RTC, you can queue up to ask questions by
typing in /RAI (raise your hand). Without further adieu, I'll ask
Dave to make some opening remarks and then we'll get to your questions
and comments. Welcome, Dave!

Thanks, Jeff! I appreciate you having us here on a special Tuesday
night conference, and missing Moonlighting just to see us. Quite a
sacrifice! Tonight I'd like to talk a little about the Spectre GCR,
and take any questions people have, then talk about a new project
Gadgets is considering. The Spectre GCR allows your Atari ST, simply
put, to become a plug and play Mac. It runs nearly all Mac software,
sometimes better than a Mac does, and has some very superior features.
It also works with Stacy, and provides, err, a "portable Mac platform",
shall we say. Jeff, would you like to split the CO into GCR and then
68030 project parts, or should I do the 68030 intro now as well?

Dave, with that tease, how could I ask you to make these folks wait
for 030 info?

Okay; here's a 70-odd line intro. I'll "upload" it into the RT. If
you need to slow it down, just press CTRL-Q, then CTRL-S to restart.

(to pause this listing while reading it, press CTRL-S; to resume the
listing, press CTRL-Q).

Gadgets' 68030 Project

Last year in May, after leaving Data Pacific, there was a
GEnie conference on whether or not I should develop a 128K ROM
Mac emulator. Many people attended, said I should, and it was a key
reason we decided to do the Spectre 128 (and Spectre GCR) products.
```

Tonight I'd like to try the same thing again: propose a new Gadgets project to you, and see if you're interested. We're already working on this product for our own internal use; we want a hot, fast ST that's competitive with the latest from NeXT and Apple. What we need to decide is if we market it to the world.

Present ST Speed / Processor

Right now, your ST is designed around an 8 Mhz 68000. This is a fine design, but, unfortunately, is starting to become dated. Newer processors, which give you far more power, are out, and at higher speeds; Apple's got the Mac II, a 68020 at 16 Mhz, and the Mac IIci, a 68030 at 25 Mhz. The NeXT is at 25 Mhz. Ultimately all that horsepower lets people write programs they couldn't write before.

68030

What we want to do is give present ST owners an *upgrade path* to a very powerful new processor: the 68030. For many rather technical reasons, a 68030 is much faster than the ST's present 68000, and could give many new capabilities to the ST -- memory mapping, memory protection for multi-tasking, better Spectre capabilities (our best thing!), and so forth.
